# Chapter 1

## Engine

### 1.1 Compilation

#### 1.1.1 Linux

Use the following command to compile the engine:

```
cmake -Bbuild  
make -Cbuild
```

Use the following command to compile the engine and its tests:

```
cmake -Bbuild -DBUILD_TESTS=ON  
make -Cbuild
```

Use the following command for create the package (.tgz or .zip) after compile:

```
cd build  
cpack
```

## Chapter 2

# Hierarchical Index

### 2.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

Archetypes . . . . .	7
Color . . . . .	8
Components . . . . .	14
Entity . . . . .	18
EntityManager . . . . .	26
World . . . . .	99
GameEngine . . . . .	37
Music . . . . .	57
Sound . . . . .	66
Transform . . . . .	86
Text . . . . .	75
DrawableComponent . . . . .	17
Text . . . . .	75
EventEngine . . . . .	32
GameEngine . . . . .	37
ITransform . . . . .	56
Text . . . . .	75
Rect< T > . . . . .	61
Rect< float > . . . . .	61
Script . . . . .	66
testing::Test	
AudioTest . . . . .	7
EntityManagerTest . . . . .	30
EntityTest . . . . .	31
EventTest . . . . .	37
GameEngineTest . . . . .	54
SpriteTest . . . . .	70
TestRect . . . . .	71
TestVector2 . . . . .	73
TestWorld . . . . .	74
TesttoSFML . . . . .	72
TransformTest . . . . .	94
toSFML . . . . .	84
Vector2< T > . . . . .	95
Vector2< float > . . . . .	95

## Chapter 3

# Class Index

### 3.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

Archetypes	7
AudioTest	7
Color	
Color class: <a href="#">Color</a> is a class that use for the color in game	8
Components	
Components class: <a href="#">Components</a> is a class that represents a component in the game	14
DrawableComponent	
DrawableComponent class: <a href="#">DrawableComponent</a> is a class that represents a drawable component in the game	17
Entity	
Entity class: <a href="#">Entity</a> is a class that represents an entity in the game	18
EntityManager	26
EntityManagerTest	30
EntityTest	31
EventEngine	
EventEngine class: <a href="#">EventEngine</a> is a class that represents the event engine of the game	32
EventTest	37
GameEngine	
GameEngine class: <a href="#">GameEngine</a> is a class that represents the game engine	37
GameEngineTest	54
ITransform	
ITransform class: <a href="#">ITransform</a> is a class that represents an interface of the Component <a href="#">Transform</a>	56
Music	
Music class: <a href="#">Music</a> is a class that represents the music in the world	57
Rect< T >	
Rect class: <a href="#">Rect</a> is a class that represents a rectangle	61
Script	66
Sound	
Sound class: <a href="#">Sound</a> is a class that represents the sound properties of a Component	66
SpriteTest	70
TestRect	71
TesttoSFML	72
TestVector2	73
TestWorld	74
Text	
Text class: <a href="#">Text</a> is a class that represents the text in the world	75

<a href="#">toSFML</a>	ToSFML class: <a href="#">toSFML</a> is a class that convert some class into SFML class . . . . .	84
<a href="#">Transform</a>	<a href="#">Transform</a> class: <a href="#">Transform</a> is a class that represents the transform of a Component . . . . .	86
<a href="#">TransformTest</a>	<a href="#">TransformTest</a> . . . . .	94
<a href="#">Vector2&lt; T &gt;</a>	Vector class: <a href="#">Vector</a> is a class that represents a vector in 2 dimensions . . . . .	95
<a href="#">World</a>	<a href="#">World</a> class: <a href="#">World</a> is a class that represents the world of the game . . . . .	99

## Chapter 4

# Class Documentation

### 4.1 Archetypes Class Reference

The documentation for this class was generated from the following file:

- `src/Archetype/include/Archetypes.h`

### 4.2 AudioTest Class Reference

Inheritance diagram for AudioTest:

Collaboration diagram for AudioTest:

## Protected Member Functions

- void **SetUp** () override
- void **TearDown** () override

## Protected Attributes

- Audio **audio**

The documentation for this class was generated from the following file:

- tests/Components/all\_components/TestAudio.cpp

## 4.3 Color Class Reference

**Color** class: **Color** is a class that use for the color in game.

```
#include <Color.h>
```

Collaboration diagram for Color:

## Public Member Functions

- **Color** ()  
*< Represent the Alpha of a color between 0 and 255.*
- **Color** (const sf::Color &sfmlColor)  
*Color constructor with sf::Color& as parameter.*
- **~Color** ()=default  
*Default override Color destructor.*
- sf::Uint8 **getRed** () const  
*getRed(): Get the sf::Uint8 red.*
- sf::Uint8 **getGreen** () const  
*getGreen(): Get the sf::Uint8 green.*

- `sf::Uint8 getBlue () const`  
*getBlue(): Get the sf::Uint8 blue.*
- `sf::Uint8 getAlpha () const`  
*getAlpha(): Get the sf::Uint8 alpha.*
- `void setRed (int newRed)`  
*setRed(int): Set the sf::Uint8 red with an int and convert into sf::Unit8 in the function.*
- `void setGreen (int newGreen)`  
*setGreen(int): Set the sf::Uint8 green with an int and convert into sf::Unit8 in the function.*
- `void setBlue (int newBlue)`  
*setBlue(int): Set the sf::Uint8 blue with an int and convert into sf::Unit8 in the function.*
- `void setAlpha (int newAlpha)`  
*setAlpha(int): Set the sf::Uint8 alpha with an int and convert into sf::Unit8 in the function.*
- `operator sf::Color () const`  
*operator sf::Color() const: Convert Color classes into sf::Color*

## Static Public Member Functions

- static `Color fromSFMLColor (const sf::Color &sfColor)`  
*fromSFMLColor(const sf::Color&): Convert SFML color into Color class.*

## Static Public Attributes

- static const `Color Black = Color::fromSFMLColor(sf::Color::Black)`
- static const `Color White = Color::fromSFMLColor(sf::Color::White)`
- static const `Color Red = Color::fromSFMLColor(sf::Color::Red)`
- static const `Color Green = Color::fromSFMLColor(sf::Color::Green)`
- static const `Color Blue = Color::fromSFMLColor(sf::Color::Blue)`
- static const `Color Yellow = Color::fromSFMLColor(sf::Color::Yellow)`
- static const `Color Magenta = Color::fromSFMLColor(sf::Color::Magenta)`
- static const `Color Cyan = Color::fromSFMLColor(sf::Color::Cyan)`
- static const `Color Transparent = Color::fromSFMLColor(sf::Color::Transparent)`

### 4.3.1 Detailed Description

`Color` class: `Color` is a class that use for the color in game.

The `Color` class manages the color.

### 4.3.2 Constructor & Destructor Documentation

#### 4.3.2.1 Color() [1/2]

```
Color::Color ( ) [inline]
```

< Represent the Alpha of a color between 0 and 255.

Default `Color` constructor.

Set the default value to "Default" and initialize red, green, blue and alpha to 255 for initialize the color white.

#### 4.3.2.2 Color() [2/2]

```
Color::Color (
    const sf::Color & sfmlColor )    [inline], [explicit]
```

[Color](#) constructor with sf::Color& as parameter.

## Parameters

<i>sfmlColor</i>	Represent a color preset or no from SFML.
------------------	---

### 4.3.2.3 ~Color()

```
Color::~~Color ( ) [default]
```

Default override [Color](#) destructor.

Set the default value to "Default".

## 4.3.3 Member Function Documentation

### 4.3.3.1 fromSFMLColor()

```
Color Color::fromSFMLColor (
    const sf::Color & sfColor ) [static]
```

[fromSFMLColor\(const sf::Color&\)](#): Convert SFML color into [Color](#) class.

## Parameters

<i>sfColor</i>	The color from SFML
----------------	---------------------

## Returns

[Color](#): [Color](#) class.

### 4.3.3.2 getAlpha()

```
sf::Uint8 Color::getAlpha ( ) const
```

[getAlpha\(\)](#): Get the sf::Uint8 alpha.

## Returns

sf::Uint8: The value of alpha.

#### 4.3.3.3 getBlue()

```
sf::Uint8 Color::getBlue ( ) const
```

[getBlue\(\)](#): Get the sf::Uint8 blue.

##### Returns

sf::Uint8: The value of blue.

#### 4.3.3.4 getGreen()

```
sf::Uint8 Color::getGreen ( ) const
```

[getGreen\(\)](#): Get the sf::Uint8 green.

##### Returns

sf::Uint8: The value of green.

#### 4.3.3.5 getRed()

```
sf::Uint8 Color::getRed ( ) const
```

[getRed\(\)](#): Get the sf::Uint8 red.

##### Returns

sf::Uint8: The value of red.

#### 4.3.3.6 operator sf::Color()

```
Color::operator sf::Color ( ) const [explicit]
```

[operator sf::Color\(\)](#) const: Convert [Color](#) classes into sf::Color

##### Returns

sf::Color: Get the [Color](#) in sf::Color

#### 4.3.3.7 setAlpha()

```
void Color::setAlpha (
    int newAlpha )
```

[setAlpha\(int\)](#): Set the sf::Uint8 alpha with an int and convert into sf::Unit8 in the function.

## Parameters

<i>newAlpha</i>	
-----------------	--

**4.3.3.8 setBlue()**

```
void Color::setBlue (
    int newBlue )
```

**setBlue(int)**: Set the sf::Uint8 blue with an int and convert into sf::Unit8 in the function.

## Parameters

<i>newBlue</i>	
----------------	--

**4.3.3.9 setGreen()**

```
void Color::setGreen (
    int newGreen )
```

**setGreen(int)**: Set the sf::Uint8 green with an int and convert into sf::Unit8 in the function.

## Parameters

<i>newGreen</i>	
-----------------	--

**4.3.3.10 setRed()**

```
void Color::setRed (
    int newRed )
```

**setRed(int)**: Set the sf::Uint8 red with an int and convert into sf::Unit8 in the function.

## Parameters

<i>newRed</i>	Number between 0 and 255.
---------------	---------------------------

The documentation for this class was generated from the following files:

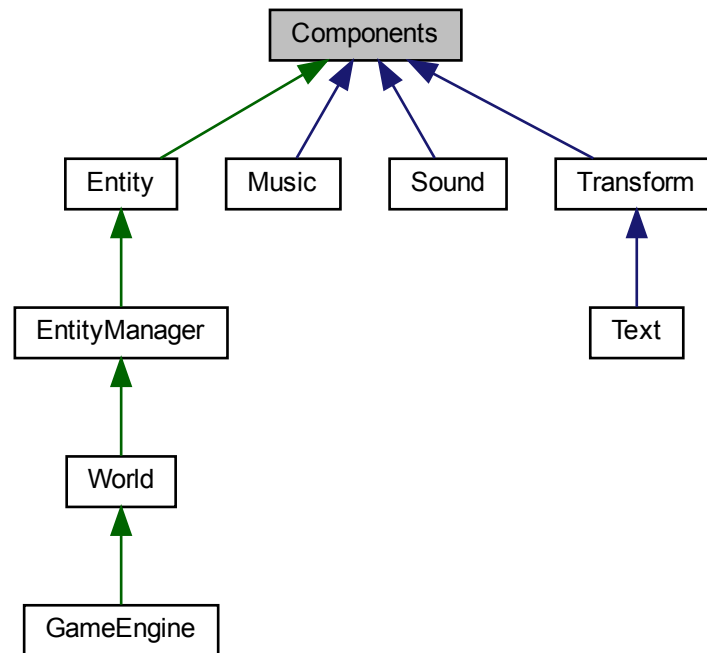

- src/Other/include/Color.h
- src/Other/Color.cpp

## 4.4 Components Class Reference

[Components](#) class: [Components](#) is a class that represents a component in the game.

```
#include <Components.h>
```

Inheritance diagram for Components:

### Public Member Functions

- [Components](#) ()=default  
*Default [Components](#) constructor.*
- virtual [~Components](#) ()=default  
*[Components](#) destructor.*
- virtual bool [init](#) ()=0  
*[init\(\)](#): Initialize the component*
- virtual int [getBit](#) ()=0  
*[getBit\(\)](#): Get the bitmask of the component*
- virtual void [update](#) (sf::Time timeDelta)=0  
*[update\(\)](#): Update the component*

#### 4.4.1 Detailed Description

[Components](#) class: [Components](#) is a class that represents a component in the game.

[Components](#) are the building blocks of the game. They are attached to entities and define their behavior.

## 4.4.2 Constructor & Destructor Documentation

### 4.4.2.1 Components()

```
Components::Components ( ) [default]
```

Default [Components](#) constructor.

#### Parameters

<i>void</i>	
-------------	--

#### Returns

void

### 4.4.2.2 ~Components()

```
virtual Components::~~Components ( ) [virtual], [default]
```

[Components](#) destructor.

#### Parameters

<i>void</i>	
-------------	--

#### Returns

void

## 4.4.3 Member Function Documentation

### 4.4.3.1 getBit()

```
virtual int Components::getBit ( ) [pure virtual]
```

[getBit\(\)](#): Get the bitmask of the component

#### Parameters

<i>void</i>	
-------------	--

**Returns**

int: bitmask of the component

Implemented in [Entity](#), and [Transform](#).

**4.4.3.2 init()**

```
virtual bool Components::init ( ) [pure virtual]
```

[init\(\)](#): Initialize the component

**Parameters**

<i>void</i>	
-------------	--

**Returns**

bool: true if the component is initialized, false otherwise

Implemented in [World](#), [EntityManager](#), [Entity](#), [Transform](#), and [Text](#).

**4.4.3.3 update()**

```
virtual void Components::update (
    sf::Time timeDelta ) [pure virtual]
```

[update\(\)](#): Update the component

**Parameters**

<i>timeDelta</i>	time elapsed since the last update
------------------	------------------------------------

**Returns**

void

Implemented in [Entity](#), [Transform](#), and [Text](#).

The documentation for this class was generated from the following file:

- `src/Components/include/Components.h`

## 4.5 DrawableComponent Class Reference

[DrawableComponent](#) class: [DrawableComponent](#) is a class that represents a drawable component in the game.

```
#include <DrawableComponent.h>
```

Inheritance diagram for DrawableComponent:

### Public Member Functions

- virtual [~DrawableComponent](#) ()=default  
Default [DrawableComponent](#) constructor.
- virtual void [draw](#) (sf::RenderWindow &window) const =0  
[draw\(\)](#): Draw the component

#### 4.5.1 Detailed Description

[DrawableComponent](#) class: [DrawableComponent](#) is a class that represents a drawable component in the game.

DrawableComponents are components that can be drawn on the screen.

#### 4.5.2 Constructor & Destructor Documentation

##### 4.5.2.1 ~DrawableComponent()

```
virtual DrawableComponent::~~DrawableComponent ( ) [virtual], [default]
```

Default [DrawableComponent](#) constructor.

Parameters

<i>void</i>	
-------------	--

**Returns**

void

### 4.5.3 Member Function Documentation

#### 4.5.3.1 draw()

```
virtual void DrawableComponent::draw (
    sf::RenderWindow & window ) const [pure virtual]
```

[draw\(\)](#): Draw the component

**Parameters**

<i>window</i>	Window to draw the component on
---------------	---------------------------------

**Returns**

void

Implemented in [Text](#).

The documentation for this class was generated from the following file:

- src/Components/include/DrawableComponent.h

## 4.6 Entity Class Reference

[Entity](#) class: [Entity](#) is a class that represents an entity in the game.

```
#include <entity.h>
```

Inheritance diagram for Entity:

Collaboration diagram for Entity:

## Public Member Functions

- [Entity](#) ()=default  
*Default [Entity](#) constructor.*
- [Entity](#) (std::string nameEntity, [Archetypes](#) newArchetype=[Archetypes](#)())  
*[Entity](#) constructor.*
- [~Entity](#) () override=default

- *Entity* destructor.
- int `getBit` () override  
*getBit()*: Get the bit of the Sprite.
- bool `init` () override  
*init()*: Initialize the entity
- std::string `getName` () const  
*genName()*: Get the name of the entity
- void `update` (sf::Time deltaTime) override  
*update(sf::Time)*: Update the component *Music*
- void `setName` (std::string newName)  
*setName()*: Set the name of the entity
- void `addDrawable` (*Components* \*component)  
*addDrawable()*: Add a drawable component to the entity
- void `drawEntity` (sf::RenderWindow &window)  
*drawEntity()*: Draw the entities
- template<typename T , typename... TArgs>  
T & `addComponent` (TArgs &&... args)  
*addComponent()*: Add a component to the entity
- template<typename T >  
T & `getComponent` ()  
*getComponent()*: Get a component from the entity
- template<typename T >  
std::size\_t `getComponentTypeID` () noexcept  
*getComponentTypeID()*: Get a component ID from the entity
- std::bitset< 6 > `getComponentBitset` () const  
*getComponentBitset()*: Get all components bitset from the entity

## Additional Inherited Members

### 4.6.1 Detailed Description

*Entity* class: *Entity* is a class that represents an entity in the game.

The *Entity* class manages components associated with the entity.

### 4.6.2 Constructor & Destructor Documentation

#### 4.6.2.1 Entity() [1/2]

```
Entity::Entity ( ) [default]
```

Default *Entity* constructor.

Parameters

<i>void</i>	
-------------	--

## Returns

void

### 4.6.2.2 Entity() [2/2]

```
Entity::Entity (
    std::string nameEntity,
    Archetypes newArchetype = Archetypes() ) [explicit]
```

[Entity](#) constructor.

## Parameters

<i>nameEntity</i>	name of the entity
<i>newArchetype</i>	archetype of the entity (optional, default = new archetype)

## Returns

void

### 4.6.2.3 ~Entity()

```
Entity::~~Entity ( ) [override], [default]
```

[Entity](#) destructor.

## Parameters

<i>void</i>	
-------------	--

## Returns

void

## 4.6.3 Member Function Documentation

### 4.6.3.1 addComponent()

```
template<typename T , typename... TArgs>
template Text & Entity::addComponent< Text > (
    TArgs &&... args )
```

[addComponent\(\)](#): Add a component to the entity

## Template Parameters

<i>T</i>	Type of the component
<i>TArgs</i>	Variadic template for component constructor arguments.

## Parameters

<i>args</i>	arguments of the component
-------------	----------------------------

## Returns

T&: reference of the component

**4.6.3.2 addDrawable()**

```
void Entity::addDrawable (
    Components * component )
```

**addDrawable()**: Add a drawable component to the entity

## Parameters

<i>component</i>	component to add
------------------	------------------

## Returns

void

**4.6.3.3 drawEntity()**

```
void Entity::drawEntity (
    sf::RenderWindow & window )
```

**drawEntity()**: Draw the entities

## Parameters

<i>window</i>	window where the entities are drawn
---------------	-------------------------------------

## Returns

void

#### 4.6.3.4 getBit()

```
int Entity::getBit ( ) [override], [virtual]
```

[getBit\(\)](#): Get the bit of the Sprite.

##### Parameters

<i>void</i>	
-------------	--

##### Returns

int: The bit of the Sprite.

Implements [Components](#).

#### 4.6.3.5 GetComponent()

```
template<typename T >  
template Text & Entity::GetComponent< Text > ( )
```

[GetComponent\(\)](#): Get a component from the entity

##### Template Parameters

<i>T</i>	Type of the component
----------	-----------------------

##### Parameters

<i>void</i>	
-------------	--

##### Returns

T&: reference of the component

#### 4.6.3.6 GetComponentBitset()

```
std::bitset< 6 > Entity::GetComponentBitset ( ) const
```

[GetComponentBitset\(\)](#): Get all components bitset from the entity

##### Parameters

<i>void</i>	
-------------	--

**Returns**

std::bitset<6>: bitset of the components

**4.6.3.7 GetComponentTypeID()**

```
template<typename T >
template std::size_t Entity::GetComponentTypeID< Text > ( ) [noexcept]
```

[GetComponentTypeID\(\)](#): Get a component ID from the entity

**Template Parameters**

<i>T</i>	Type of the component
----------	-----------------------

**Parameters**

<i>void</i>	
-------------	--

**Returns**

std::size\_t: id of the component

**4.6.3.8 getName()**

```
std::string Entity::getName ( ) const
```

getName(): Get the name of the entity

**Parameters**

<i>void</i>	
-------------	--

**Returns**

std::string: name of the entity

**4.6.3.9 init()**

```
bool Entity::init ( ) [override], [virtual]
```

[init\(\)](#): Initialize the entity

## Parameters

<i>void</i>	
-------------	--

## Returns

bool: true if the entity is initialized, false otherwise

Implements [Components](#).

Reimplemented in [World](#), and [EntityManager](#).

#### 4.6.3.10 setName()

```
void Entity::setName (
    std::string newName )
```

[setName\(\)](#): Set the name of the entity

## Parameters

<i>newName</i>	new name of the entity
----------------	------------------------

## Returns

void

#### 4.6.3.11 update()

```
void Entity::update (
    sf::Time deltaTime ) [override], [virtual]
```

[update\(sf::Time\)](#): Update the component [Music](#)

## Parameters

<i>timeDelta</i>	sf::Time of the game.
------------------	-----------------------

Implements [Components](#).

The documentation for this class was generated from the following files:

- src/Entity/include/entity.h
- src/Entity/entity.cpp

## 4.7 EntityManager Class Reference

Inheritance diagram for EntityManager:

Collaboration diagram for EntityManager:

## Public Member Functions

- [EntityManager](#) ()=default  
*Default [EntityManager](#) constructor.*
- [~EntityManager](#) () override=default  
*[EntityManager](#) destructor.*
- bool [init](#) () override  
*[initEntityManager\(\)](#): Initialize the [EntityManager](#).*
- [Entity](#) & [addEntity](#) (const std::string &nameEntity, [Archetypes](#) newArchetype=[Archetypes](#)())  
*[addEntity\(\)](#): Create and add a new entity to the entity manager.*
- [Entity](#) & [getEntity](#) (const std::string &nameEntity)  
*[getEntity\(\)](#): Get an entity from the entity manager by its name.*
- std::map< std::string, [Entity](#) \* > [getEntities](#) () const  
*[getEntities\(\)](#): Get the [EntityManager](#)'s entities.*
- std::map< std::string, [Entity](#) \* > [getEntityMap](#) () const  
*[getEntityMap\(\)](#): Get the [EntityManager](#)'s entity map.*

## Additional Inherited Members

### 4.7.1 Constructor & Destructor Documentation

#### 4.7.1.1 EntityManager()

```
EntityManager::EntityManager ( ) [default]
```

Default [EntityManager](#) constructor.

##### Parameters

<i>void</i>	
-------------	--

##### Returns

void

#### 4.7.1.2 ~EntityManager()

```
EntityManager::~~EntityManager ( ) [override], [default]
```

[EntityManager](#) destructor.

##### Parameters

<i>void</i>	
-------------	--

## Returns

void

## 4.7.2 Member Function Documentation

### 4.7.2.1 addEntity()

```
Entity & EntityManager::addEntity (
    const std::string & nameEntity,
    Archetypes newArchetype = Archetypes() )
```

**addEntity()**: Create and add a new entity to the entity manager.

## Template Parameters

<i>T</i>	Type of the entity.
<i>TArgs</i>	Type of the arguments.

## Parameters

<i>args</i>	Arguments of the entity.
-------------	--------------------------

### 4.7.2.2 getEntities()

```
std::map< std::string, Entity * > EntityManager::getEntities ( ) const
```

**getEntities()**: Get the **EntityManager**'s entities.

## Parameters

<i>void</i>	
-------------	--

## Returns

std::map<std::string, Entity \*>: Entities.

### 4.7.2.3 getEntity()

```
Entity & EntityManager::getEntity (
    const std::string & nameEntity )
```

**getEntity()**: Get an entity from the entity manager by its name.

## Template Parameters

<i>T</i>	Type of the entity.
----------	---------------------

## Parameters

<i>nameEntity</i>	Name of the entity.
-------------------	---------------------

## Returns

T&: Reference of the entity.

**4.7.2.4 getEntityMap()**

```
std::map< std::string, Entity * > EntityManager::getEntityMap ( ) const
```

[getEntityMap\(\)](#): Get the [EntityManager](#)'s entity map.

## Parameters

<i>void</i>	
-------------	--

## Returns

Entity::EntityMap: [Entity](#) map.

**4.7.2.5 init()**

```
bool EntityManager::init ( ) [override], [virtual]
```

[initEntityManager\(\)](#): Initialize the [EntityManager](#).

## Parameters

<i>void</i>	
-------------	--

## Returns

bool: true if the [EntityManager](#) is initialized, false otherwise.

Reimplemented from [Entity](#).

Reimplemented in [World](#).

The documentation for this class was generated from the following files:

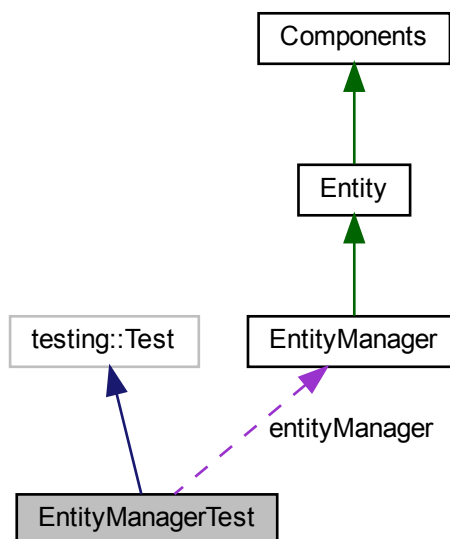

- src/Entity/include/entityManager.h
- src/Entity/entityManager.cpp

## 4.8 EntityManagerTest Class Reference

Inheritance diagram for EntityManagerTest:

## 4.10 EventEngine Class Reference

[EventEngine](#) class: [EventEngine](#) is a class that represents the event engine of the game.

```
#include <eventEngine.h>
```

Inheritance diagram for EventEngine:

## Public Member Functions

- [EventEngine](#) ()=default  
*Default [EventEngine](#) constructor.*
- virtual [~EventEngine](#) ()=default  
*[EventEngine](#) destructor.*
- `sf::Event & getEvent ()`  
*[getEvent\(\)](#): Get the SFML Event.*
- void [addKeyPressed](#) (`sf::Keyboard::Key` keyboard, `const std::function< void()> &function`)  
*[addKeyPressed\(\)](#): Add a key pressed to the map.*
- void [addMouseButtonPressed](#) (`sf::Mouse::Button` mouse, `const std::function< void()> &function`)  
*[addMouseButtonPressed\(\)](#): Add a mouse button pressed to the map.*
- void [addMouseMoved](#) (`const std::string &nameEntity`, `const std::function< void()> &function`)  
*[addMouseMoved\(\)](#): Add a mouse moved to the map.*
- `std::map< sf::Keyboard::Key, std::function< void()> > & getKeyPressedMap ()`  
*[getKeyPressedMap\(\)](#): Get the map of the key pressed.*
- `std::map< sf::Mouse::Button, std::function< void()> > & getMouseButtonPressedMap ()`  
*[getMouseButtonPressedMap\(\)](#): Get the map of the mouse button pressed.*
- `std::map< std::string, std::function< void()> > & getMouseMovedMap ()`  
*[getMouseMovedPressedMap\(\)](#): Get the map of the key pressed.*
- `std::map< sf::Keyboard::Key, bool > & getKeyStatesMap ()`  
*[getKeyStatesMap\(\)](#): Get the map of the key states.*
- void [setKeyStatesMap](#) (`sf::Keyboard::Key` key)  
*[setKeyStatesMap\(sf::Keyboard::Key\)](#): Initialize the map of the key states for the parameter value to false*

### 4.10.1 Detailed Description

[EventEngine](#) class: [EventEngine](#) is a class that represents the event engine of the game.

The [EventEngine](#) class manages the events of the game.

### 4.10.2 Constructor & Destructor Documentation

#### 4.10.2.1 EventEngine()

```
EventEngine::EventEngine ( ) [default]
```

Default [EventEngine](#) constructor.

##### Parameters

<i>void</i>	
-------------	--

##### Returns

void

#### 4.10.2.2 ~EventEngine()

```
virtual EventEngine::~~EventEngine ( ) [virtual], [default]
```

[EventEngine](#) destructor.

##### Parameters

<i>void</i>	
-------------	--

##### Returns

void

### 4.10.3 Member Function Documentation

#### 4.10.3.1 addKeyPressed()

```
void EventEngine::addKeyPressed (
    sf::Keyboard::Key keyboard,
    const std::function< void()> & function )
```

[addKeyPressed\(\)](#): Add a key pressed to the map.

##### Parameters

<i>keyboard</i>	SFML Keyboard::Key of the key pressed.
<i>function</i>	Function to execute when the key is pressed.

##### Returns

void

#### 4.10.3.2 addMouseButtonPressed()

```
void EventEngine::addMouseButtonPressed (
    sf::Mouse::Button mouse,
    const std::function< void()> & function )
```

[addMouseButtonPressed\(\)](#): Add a mouse button pressed to the map.

##### Parameters

<i>mouse</i>	SFML Mouse::Button of the mouse button pressed.
<i>function</i>	Function to execute when the mouse button is pressed.

##### Returns

void

#### 4.10.3.3 addMouseMoved()

```
void EventEngine::addMouseMoved (
    const std::string & nameEntity,
    const std::function< void()> & function )
```

[addMouseMoved\(\)](#): Add a mouse moved to the map.

##### Parameters

<i>nameEntity</i>	: Name of the <a href="#">Entity</a> you want.
<i>function</i>	Function to execute when the mouse moved on entity.

**Returns**

void

**4.10.3.4 getEvent()**

```
sf::Event & EventEngine::getEvent ( )
```

[getEvent\(\)](#): Get the SFML Event.

**Parameters**

void	
------	--

**Returns**

sf::Event: The SFML Event.

**4.10.3.5 getKeyPressedMap()**

```
std::map< sf::Keyboard::Key, std::function< void()> > & EventEngine::getKeyPressedMap ( )
```

[getKeyPressedMap\(\)](#): Get the map of the key pressed.

**Parameters**

void	
------	--

**Returns**

std::map<sf::Keyboard::Key, std::function<void()>>: The map of the key pressed.

**4.10.3.6 getKeyStatesMap()**

```
std::map< sf::Keyboard::Key, bool > & EventEngine::getKeyStatesMap ( )
```

[getKeyStatesMap\(\)](#): Get the map of the key states.

**Returns**

std::map<sf::Keyboard::Key, bool>&: The map of the key states.

#### 4.10.3.7 getMouseButtonPressedMap()

```
std::map< sf::Mouse::Button, std::function< void()> > & EventEngine::getMouseButtonPressedMap
( )
```

[getMouseButtonPressedMap\(\)](#): Get the map of the mouse button pressed.

##### Parameters

<i>void</i>	
-------------	--

##### Returns

`std::map<sf::Mouse::Button, std::function<void()>>`: The map of the mouse button pressed.

#### 4.10.3.8 getMouseMovedMap()

```
std::map< std::string, std::function< void()> > & EventEngine::getMouseMovedMap ( )
```

[getMouseMovedPressedMap\(\)](#): Get the map of the key pressed.

##### Parameters

<i>void</i>	
-------------	--

##### Returns

`std::map<std::string, std::function<void()>>`: The map of the mouse moved.

#### 4.10.3.9 setKeyStatesMap()

```
void EventEngine::setKeyStatesMap (
    sf::Keyboard::Key key )
```

[setKeyStatesMap\(sf::Keyboard::Key\)](#): Initialize the map of the key states for the parameter value to false

##### Parameters

<i>key</i>	The touch of the keyboard with using SFML.
------------	--

The documentation for this class was generated from the following files:

- `src/Event/include/eventEngine.h`

### 4.12.1 Detailed Description

[GameEngine](#) class: [GameEngine](#) is a class that represents the game engine.

The [GameEngine](#) class manages the game engine.

### 4.12.2 Constructor & Destructor Documentation

#### 4.12.2.1 [GameEngine\(\)](#) [1/2]

```
GameEngine::GameEngine ( ) [default]
```

< Time of the game. Using with the Clock.

Default [GameEngine](#) constructor.

##### Parameters

<i>void</i>	
-------------	--

##### Returns

void

#### 4.12.2.2 [GameEngine\(\)](#) [2/2]

```
GameEngine::GameEngine (
    sf::VideoMode mode,
    const sf::String & title,
    sf::Uint32 style = sf::Style::Default,
    const sf::ContextSettings & settings = sf::ContextSettings() )
```

[GameEngine](#) constructor with parameters.

## Parameters

<i>mode</i>	Video mode.
<i>type</i>	Type of the graphics ("2D" or "3D").
<i>title</i>	Title of the window.
<i>style</i>	Style of the window (sf::Style::Default by default).
<i>settings</i>	Settings of the window.

## Returns

void

## 4.12.2.3 ~GameEngine()

```
GameEngine::~GameEngine ( ) [override], [default]
```

[GameEngine](#) destructor.

## Parameters

<i>void</i>	
-------------	--

## Returns

void

## 4.12.3 Member Function Documentation

## 4.12.3.1 addWorld()

```
World& GameEngine::addWorld (
    const std::string & nameWorld,
    std::unique_ptr< World > world )
```

[addWorld\(\)](#): Add a world to the world map.

## Parameters

<i>nameWorld</i>	Name of the world.
<i>world</i>	<a href="#">World</a> to add.

## Returns

[World&](#): The world.

### 4.12.3.2 eventGameEngine()

```
void GameEngine::eventGameEngine ( )
```

[eventGameEngine\(\)](#): Manage the events of the game engine.

## Parameters

<i>void</i>	
-------------	--

## Returns

void

### 4.12.3.3 getClock()

```
sf::Clock GameEngine::getClock ( ) const
```

[getClock\(\)](#): Get [GameEngine](#)'s clock.

## Parameters

<i>void</i>	
-------------	--

## Returns

sf::Clock: [GameEngine](#)'s clock.

### 4.12.3.4 getCurrentWorld()

```
World* GameEngine::getCurrentWorld ( ) const
```

[getCurrentWorld\(\)](#): Get [GameEngine](#)'s current world.

## Parameters

<i>void</i>	
-------------	--

**Returns**

World\*: [GameEngine](#)'s current world.

**4.12.3.5 getDeltaTime()**

```
sf::Time GameEngine::getDeltaTime ( ) const
```

[getDeltaTime\(\)](#): Get [GameEngine](#)'s deltaTime.

**Parameters**

<i>void</i>	
-------------	--

**Returns**

sf::Time: [GameEngine](#)'s deltaTimes.

**4.12.3.6 getEventEngine()**

```
EventEngine& GameEngine::getEventEngine ( )
```

[getEventEngine\(\)](#): Get the event engine.

**Parameters**

<i>void</i>	
-------------	--

**Returns**

[EventEngine&](#): [GameEngine](#)'s [EventEngine](#).

**4.12.3.7 getFilesRessources()**

```
static std::vector<std::string> GameEngine::getFilesRessources (
    const std::string & pathDirectory ) [static]
```

[getFilesRessources\(\)](#): Get all the ressources type files in the given directory.

**Parameters**

<i>pathDirectory</i>	Path of the directory.
----------------------	------------------------

**Returns**

`std::vector<std::string>`: Vector of the ressources type files' names.

**4.12.3.8 getMapFont()**

```
std::map<std::string, std::shared_ptr<sf::Font> > GameEngine::getMapFont ( ) const
```

[getMapFont\(\)](#): Get [GameEngine](#)'s map of the font.

**Parameters**

<i>void</i>	
-------------	--

**Returns**

`std::map<std::string, std::shared_ptr<sf::Font>>`: [GameEngine](#)'s map of the musics.

**4.12.3.9 getMapMusic()**

```
std::map<std::string, std::shared_ptr<sf::Music> > GameEngine::getMapMusic ( ) const
```

[getMapMusic\(\)](#): Get [GameEngine](#)'s map of the music.

**Parameters**

<i>void</i>	
-------------	--

**Returns**

`std::map<std::string, std::shared_ptr<sf::Music>>`: [GameEngine](#)'s map of the musics.

**4.12.3.10 getMapSound()**

```
std::map<std::string, std::shared_ptr<sf::SoundBuffer> > GameEngine::getMapSound ( ) const
```

[getMapSound\(\)](#): Get [GameEngine](#)'s map of the sound.

**Parameters**

<i>void</i>	
-------------	--

**Returns**

`std::map<std::string, std::shared_ptr<sf::SoundBuffer>>`: [GameEngine](#)'s map of the musics.

**4.12.3.11 getMapTexture()**

```
std::map<std::string, std::shared_ptr<sf::Texture> > GameEngine::getMapTexture ( ) const
```

[getMapTexture\(\)](#): Get [GameEngine](#)'s map of the textures.

**Parameters**

<i>void</i>	
-------------	--

**Returns**

`std::map<std::string, std::shared_ptr<sf::Texture>>`: [GameEngine](#)'s map of the textures.

**4.12.3.12 getWindow()**

```
sf::RenderWindow& GameEngine::getWindow ( )
```

[getWindow\(\)](#): Get the window.

**Parameters**

<i>void</i>	
-------------	--

**Returns**

`std::variant<std::unique_ptr<sf::Window>, std::unique_ptr<sf::RenderWindow>>`: The [GameEngine](#)'s window

**4.12.3.13 getWorld()**

```
World& GameEngine::getWorld (
    const std::string & nameWorld )
```

[getWorld\(\)](#): Get a world from the world map with its name.

**Parameters**

<i>nameWorld</i>	Name of the world.
------------------	--------------------

## Returns

[World](#)&: [GameEngine](#)'s world.

#### 4.12.3.14 `getWorldMap()`

```
std::map<std::string, World *> GameEngine::getWorldMap ( ) const
```

[getWorldMap\(\)](#): Get [GameEngine](#)'s map of the worlds.

## Parameters

<i>void</i>	
-------------	--

## Returns

`std::map<std::string, World*`>: [GameEngine](#)'s map of the worlds.

#### 4.12.3.15 `initialize()`

```
void GameEngine::initialize (
    std::map< std::string, std::unique_ptr< World >> mapWorld,
    const std::map< std::string, std::string > & pathRessources,
    const std::string & firstScene )
```

[initialize\(\)](#): Initialize the game engine.

## Parameters

<i>mapWorld</i>	Map of <a href="#">World</a> classes' unique pointers.
<i>pathRessources</i>	Map of the path of the ressources (assets).
<i>firstScene</i>	Name of the first scene.

## Returns

`void`

#### 4.12.3.16 `initializeAllFiles()`

```
void GameEngine::initializeAllFiles (
    const std::map< std::string, std::string > & pathRessources )
```

[initializeAllFiles\(\)](#): Initialize all the ressources files the engine need.

**Parameters**

<i>void</i>	
-------------	--

**Returns**

void

**4.12.3.17 initializeFont()**

```
void GameEngine::initializeFont (
    std::string path )
```

[initializeMusic\(\)](#): Initialize the font with their path.

**Parameters**

<i>path</i>	Path of the texture.
-------------	----------------------

**Returns**

void

**4.12.3.18 initializeMusic()**

```
void GameEngine::initializeMusic (
    std::string path )
```

[initializeMusic\(\)](#): Initialize the music with their path.

**Parameters**

<i>path</i>	Path of the texture.
-------------	----------------------

**Returns**

void

**4.12.3.19 initializeMusicFunction()**

```
void GameEngine::initializeMusicFunction ( ) const
```

[initializeMusicFunction\(\)](#): Initialize the music function.

## Parameters

<i>void</i>	
-------------	--

## Returns

void

**4.12.3.20 initializeSound()**

```
void GameEngine::initializeSound (
    std::string path )
```

[initializeSound\(\)](#): Initialize the sound with their path.

## Parameters

<i>path</i>	Path of the texture.
-------------	----------------------

## Returns

void

**4.12.3.21 initializeSoundFunction()**

```
void GameEngine::initializeSoundFunction ( ) const
```

[initializeSoundFunction\(\)](#): Initialize the sound function.

## Parameters

<i>void</i>	
-------------	--

## Returns

void

**4.12.3.22 initializeSpriteFunction()**

```
void GameEngine::initializeSpriteFunction ( ) const
```

[initializeSpriteFunction\(\)](#): Initialize the sprites function.

**Parameters**

<i>void</i>	
-------------	--

**Returns**

void

**4.12.3.23 initializeTextFunction()**

```
void GameEngine::initializeTextFunction ( ) const
```

initializeFontFunction(): Initialize the font function.

**Parameters**

<i>void</i>	
-------------	--

**Returns**

void

**4.12.3.24 initializeTexture()**

```
void GameEngine::initializeTexture (
    std::string path )
```

[initializeTexture\(\)](#): Initialize the textures with their path.

**Parameters**

<i>path</i>	Path of the texture.
-------------	----------------------

**Returns**

void

**4.12.3.25 initializeWorldMap()**

```
void GameEngine::initializeWorldMap (
    std::map< std::string, std::unique_ptr< World >> mapWorld )
```

[initializeWorldMap\(\)](#): Initialize the world map.

## Parameters

<i>mapWorld</i>	Map of <a href="#">World</a> classes' unique pointers.
-----------------	--

## Returns

void

**4.12.3.26 isWindowOpen()**

```
bool GameEngine::isWindowOpen ( )
```

[isWindowOpen\(\)](#): Check if the window is open.

## Parameters

<i>void</i>	
-------------	--

## Returns

bool: True if the window is open, false otherwise.

**4.12.3.27 renderGameEngine()**

```
void GameEngine::renderGameEngine ( )
```

[renderGameEngine\(\)](#): Render the game engine.

## Parameters

<i>void</i>	
-------------	--

## Returns

void

**4.12.3.28 run()**

```
void GameEngine::run (
    std::map< std::string, std::unique_ptr< World >> mapWorld,
```

```
const std::map< std::string, std::string > & pathResources,  
const std::string & firstScene )
```

[run\(\)](#): Run the game engine (with parameters).

## Parameters

<i>mapWorld</i>	Map of <a href="#">World</a> classes' unique pointers.
<i>pathResources</i>	Map of the path of the ressources (assets).
<i>firstScene</i>	Name of the first scene.

## Returns

void

**4.12.3.29 setCurrentWorld()**

```
void GameEngine::setCurrentWorld (
    World * world )
```

[setCurrentWorld\(\)](#): Set [GameEngine](#)'s current world.

## Parameters

<i>world</i>	<a href="#">World</a> to set.
--------------	-------------------------------

## Returns

void

**4.12.3.30 setDeltaTime()**

```
void GameEngine::setDeltaTime (
    sf::Time newTimeDelta )
```

[setDeltaTime\(\)](#): Set [GameEngine](#)'s deltaTime.

## Parameters

<i>newTimeDelta</i>	New deltaTime for <a href="#">GameEngine</a> 's deltaTime.
---------------------	--

## Returns

void

#### 4.12.3.31 updateGameEngine()

```
void GameEngine::updateGameEngine ( )
```

[updateGameEngine\(\)](#): Update the game engine.

##### Parameters

<i>void</i>	
-------------	--

##### Returns

void

The documentation for this class was generated from the following files:

- src/GameEngine/include/gameEngine.h
- src/GameEngine/gameEngine.cpp

## 4.13 GameEngineTest Class Reference

Inheritance diagram for GameEngineTest:

Collaboration diagram for GameEngineTest:

### Protected Member Functions

- void **TearDown** () override

### Protected Attributes

- [GameEngine](#) \* **gameEngine**

The documentation for this class was generated from the following file:

- tests/GameEngine/TestGameEngine.cpp

## 4.14 ITransform Class Reference

[ITransform](#) class: [ITransform](#) is a class that represents an interface of the Component [Transform](#).

```
#include <ITransform.h>
```

Inheritance diagram for ITransform:

### Public Member Functions

- virtual [~ITransform](#) ()=default  
Default Virtual [ITransform](#) destructor.
- virtual [Transform](#) \* [getTransform](#) ()=0  
[getTransform\(\)](#): Get the reference of the component [Transform](#) of the same [Entity](#)

#### 4.14.1 Detailed Description

[ITransform](#) class: [ITransform](#) is a class that represents an interface of the Component [Transform](#).

The [ITransform](#) interface give to components which need to have a reference to [Transform](#)

#### 4.14.2 Constructor & Destructor Documentation

##### 4.14.2.1 ~ITransform()

```
virtual ITransform::~~ITransform ( ) [virtual], [default]
```

Default Virtual [ITransform](#) destructor.

Set the default value to "Default".

### 4.14.3 Member Function Documentation

#### 4.14.3.1 getTransform()

```
virtual Transform* ITransform::getTransform ( ) [pure virtual]
```

[getTransform\(\)](#): Get the reference of the component [Transform](#) of the same [Entity](#)

Virtual function which get the reference of the [Transform](#) component from the same [Entity](#) when a component need to use [Transform](#). If [Transform](#) don't exist [getTransform\(\)](#) return nullptr.

#### Returns

Transform\*: The reference of [Transform](#) or nullptr.

Implemented in [Text](#).

The documentation for this class was generated from the following file:

- `src/Components/all_components/include/ITransform.h`

## 4.15 Music Class Reference

[Music](#) class: [Music](#) is a class that represents the music in the world.

```
#include <Music.h>
```

Inheritance diagram for Music:

Collaboration diagram for Music:

## Public Member Functions

- `Music()`=default  
*< Bit of the `Music`*
- `~Music()` override=default  
*Default override `Music` destructor.*
- `<<<<<<< HEAD void setMusic(std::map< std::string, std::shared_ptr< sf::Music >> mapMusic, std::string nameMusic);=====int getBit() override;void update(sf::Time timeDelta) override;bool init() override;>>>>>> a81756f4([m] Engine:) void setMusic(std void setDeferredMusic (std::function< void()> setter)`  
*setMusic(std::map<std::string, std::shared\_ptr<sf::Music>>, const std::string&): Initialize the sf::Music of the class.*
- `void applyDeferredMusic ()`  
*applyDeferredMusic(): Apply the deferred function for `Music`*
- `std::shared_ptr< sf::Music > getMusic () const`  
*getMusic(): Get the music.*
- `void play ()`  
*play(): Play the music.*
- `void pause ()`  
*pause(): Pause the music.*
- `void stop ()`  
*stop(): Stop the music.*
- `void setLoop (bool loop)`  
*setLoop(bool): Set the loop of the music.*
- `bool getLoop () const`  
*getLoop(): Get if the loop is set to True or False.*
- `void setVolume (float volume)`  
*setVolume(float): Set the volume of the music.*
- `float getVolume () const`  
*getVolume(): Get the volume of the music.*
- `sf::SoundSource::Status getStatus () const`  
*getStatus(): Get the status of the music. Playing, pause or stop.*

### 4.15.1 Detailed Description

`Music` class: `Music` is a class that represents the music in the world.

The music class manages the music from an `Entity` using SFML.

## 4.15.2 Constructor & Destructor Documentation

### 4.15.2.1 Music()

```
Music::Music ( ) [default]
```

< Bit of the [Music](#)

Default [Music](#) constructor.

Set the default value to "Default".

### 4.15.2.2 ~Music()

```
Music::~~Music ( ) [override], [default]
```

Default override [Music](#) destructor.

Set the default value to "Default".

## 4.15.3 Member Function Documentation

### 4.15.3.1 getLoop()

```
bool Music::getLoop ( ) const
```

[getLoop\(\)](#): Get if the loop is set to True or False.

#### Returns

bool: True or False.

### 4.15.3.2 getMusic()

```
std::shared_ptr< sf::Music > Music::getMusic ( ) const
```

[getMusic\(\)](#): Get the music.

#### Returns

std::shared\_ptr<sf::Music>: The shared ptr of the music.

#### 4.15.3.3 getStatus()

```
sf::SoundSource::Status Music::getStatus ( ) const
```

[getStatus\(\)](#): Get the status of the music. Playing, pause or stop.

##### Returns

sf::SoundSource::Status: Enumerator of sf::SoundSource::Status which is (Stopped, Paused, Playing).

#### 4.15.3.4 getVolume()

```
float Music::getVolume ( ) const
```

[getVolume\(\)](#): Get the volume of the music.

##### Returns

float: Float number that represents the volume between 0 and 100 of the music.

#### 4.15.3.5 setDeferredMusic()

```
<<<<<<< HEAD void setMusic(std::map<std::string, std::shared_ptr<sf::Music>> mapMusic,
std::string nameMusic); ===== int getBit() override; void update(sf::Time timeDelta) override;
bool init() override; >>>>>> a81756f4 ([m] Engine:) void setMusic(std void Music::set←
DeferredMusic (
    std::function< void()> setter )
```

setMusic(std::map<std::string, std::shared\_ptr<sf::Music>>, const std::string&): Initialize the sf::Music of the class.

##### Parameters

<i>mapMusic</i>	Map of all the music loaded.
<i>nameMusic</i>	Name of the music loaded.

[setDeferredMusic\(std::function<void\(\)>\)](#): Set the deferred function for [Music](#).

##### Parameters

<i>setter</i>	Function that will use <a href="#">Music</a> .
---------------	--

## 4.15.3.6 setLoop()

```
void Music::setLoop (
    bool loop )
```

[setLoop\(bool\)](#): Set the loop of the music.

## Parameters

<i>loop</i>	True or False.
-------------	----------------

## 4.15.3.7 setVolume()

```
void Music::setVolume (
    float volume )
```

[setVolume\(float\)](#): Set the volume of the music.

## Parameters

<i>volume</i>	Float number that represents the volume between 0 and 100 of the music.
---------------	---

The documentation for this class was generated from the following files:

- src/Components/all\_components/include/Music.h
- src/Components/all\_components/Music.cpp

## 4.16 Rect&lt; T &gt; Class Template Reference

[Rect](#) class: [Rect](#) is a class that represents a rectangle.

```
#include <Rect.h>
```

## Public Member Functions

- [Rect](#) (T left, T top, T width, T height)  
*< Rect is the variable you can use for change the data in RectStruct.*
- [~Rect](#) ()=default  
*Rect destructor.*
- RectStruct [getRect](#) () const  
*getRect(): Get the using RectStruct.*
- T [getLeft](#) () const  
*getLeft(): Get the using RectStruct left.*
- T [getTop](#) () const  
*getTop(): Get the using RectStruct top.*

- T `getWidth` () const  
*getWidth(): Get the using RectStruct width.*
- T `getHeight` () const  
*getHeight(): Get the using RectStruct height.*
- bool `contains` (T x, T y) const  
*contains(): Check if a point is in the rectangle.*

### 4.16.1 Detailed Description

```
template<typename T>
class Rect< T >
```

`Rect` class: `Rect` is a class that represents a rectangle.

This create a rectangle and using for what you want.

### 4.16.2 Constructor & Destructor Documentation

#### 4.16.2.1 Rect()

```
template<typename T >
Rect< T >::Rect (
    T left,
    T top,
    T width,
    T height ) [inline]
```

< `Rect` is the variable you can use for change the data in RectStruct.

`Rect` constructor with parameters.

#### Template Parameters

<code>T</code>	Type of the rect.
----------------	-------------------

#### Parameters

<i>left</i>	Position x.
<i>top</i>	Position y.
<i>width</i>	Width of your rectangle.
<i>height</i>	Height of your rectangle.

#### Returns

void

### 4.16.2.2 ~Rect()

```
template<typename T >
Rect< T >::~~Rect ( ) [default]
```

Rect destructor.

#### Template Parameters

<i>T</i>	Type of the rect.
----------	-------------------

#### Parameters

<i>void</i>	
-------------	--

#### Returns

void

## 4.16.3 Member Function Documentation

### 4.16.3.1 contains()

```
template<typename T >
template bool Rect< T >::contains (
    T x,
    T y ) const
```

[contains\(\)](#): Check if a point is in the rectangle.

#### Template Parameters

<i>T</i>	Type of the rect.
----------	-------------------

#### Parameters

<i>x</i>	: Position x of the point.
<i>y</i>	: Position y of the point.

#### Returns

T : T is the type you want (float, int,...).

#### 4.16.3.2 getHeight()

```
template<typename T >
template int Rect< T >::getHeight ( ) const
```

[getHeight\(\)](#): Get the using RectStruct height.

##### Template Parameters

<i>T</i>	Type of the rect.
----------	-------------------

##### Parameters

<i>void</i>	
-------------	--

##### Returns

T : T is the type you want (float, int,...).

#### 4.16.3.3 getLeft()

```
template<typename T >
template int Rect< T >::getLeft ( ) const
```

[getLeft\(\)](#): Get the using RectStruct left.

##### Template Parameters

<i>T</i>	Type of the rect.
----------	-------------------

##### Parameters

<i>void</i>	
-------------	--

##### Returns

T : T is the type you want (float, int,...).

#### 4.16.3.4 getRect()

```
template<typename T >
Rect< T >::RectStruct Rect< T >::getRect
```

[getRect\(\)](#): Get the using RectStruct.

**Parameters**

<i>void</i>	
-------------	--

**Returns**

Rect

**4.16.3.5 getTop()**

```
template<typename T >
template int Rect< T >::getTop ( ) const
```

**getTop()**: Get the using RectStruct top.

**Template Parameters**

<i>T</i>	Type of the rect.
----------	-------------------

**Parameters**

<i>void</i>	
-------------	--

**Returns**

T : T is the type you want (float, int,...).

**4.16.3.6 getWidth()**

```
template<typename T >
template int Rect< T >::getWidth ( ) const
```

**getWidth()**: Get the using RectStruct width.

**Template Parameters**

<i>T</i>	Type of the rect.
----------	-------------------

**Parameters**

<i>void</i>	
-------------	--

#### Returns

T : T is the type you want (float, int,...).

The documentation for this class was generated from the following files:

- src/Other/include/Rect.h
- src/Other/Rect.cpp

## 4.17 Script Class Reference

### Public Member Functions

- virtual void **execute** ()=0

The documentation for this class was generated from the following file:

*[play](#)(): Play the sound.*
- `void pause()`  
*[pause](#)(): Pause the sound.*
- `void stop()`  
*[stop](#)(): Stop the sound.*
- `void setLoop(bool loop)`  
*[setLoop](#)(bool): Set the loop of the sound.*
- `bool getLoop() const`  
*[getLoop](#)(): Get if the loop is set to True or False.*
- `void setVolume(float volume)`  
*[setVolume](#)(float): Set the volume of the sound.*
- `float getVolume() const`  
*[getVolume](#)(): Get the volume of the sound.*
- `bool isPlaying() const`  
*[isPlaying](#)(): Check if the sound is currently playing.*

### 4.18.1 Detailed Description

`Sound` class: `Sound` is a class that represents the sound properties of a Component.

The `Sound` class manages the sound representation of a Component using SFML.

### 4.18.2 Constructor & Destructor Documentation

#### 4.18.2.1 `Sound()`

```
Sound::Sound ( ) [default]
```

*< Bit of the [Sound](#).*

Default `Sound` constructor.

Set the default value to "Default".

#### 4.18.2.2 ~Sound()

```
Sound::~~Sound ( ) [override], [default]
```

Default override [Sound](#) destructor.

Set the default value to "Default".

### 4.18.3 Member Function Documentation

#### 4.18.3.1 getLoop()

```
bool Sound::getLoop ( ) const
```

[getLoop\(\)](#): Get if the loop is set to True or False.

##### Returns

bool: True or False.

#### 4.18.3.2 getSound()

```
const sf::Sound& Sound::getSound ( ) const
```

[getSound\(\)](#): Get the sound.

##### Returns

const sf::Sound&: The shared ptr of the sound.

#### 4.18.3.3 getVolume()

```
float Sound::getVolume ( ) const
```

[getVolume\(\)](#): Get the volume of the sound.

##### Returns

float: Float number that represents the volume between 0 and 100 of the sound.

#### 4.18.3.4 isPlaying()

```
bool Sound::isPlaying ( ) const
```

[isPlaying\(\)](#): Check if the sound is currently playing.

##### Returns

bool: True if the sound is playing, false otherwise.

#### 4.18.3.5 setDeferredSound()

```
void Sound::setDeferredSound (
    std::function< void()> setter )
```

[setDeferredSound\(std::function<void\(\)>\)](#): Set the deferred function for [Sound](#).

##### Parameters

<i>setter</i>	Function that will use <a href="#">Sound</a> .
---------------	--

#### 4.18.3.6 setLoop()

```
void Sound::setLoop (
    bool loop )
```

[setLoop\(bool\)](#): Set the loop of the sound.

##### Parameters

<i>loop</i>	True or False.
-------------	----------------

#### 4.18.3.7 setSound()

```
<<<<<<< HEAD bool loadSoundBuffer(const std::string& filePath); ===== int getBit() override;
void update(sf::Time timeDelta) override; bool init() override; >>>>>> a81756f4 ([m] Engine←
:) void setSound( const sf void Sound::setSound (
    std::map< std::string, std::shared_ptr< sf::SoundBuffer >> mapSound,
    const std::string & nameSound )
```

[setSound\(const sf::Sound&\)](#): Set the sound with an existing one. Automatically set the component sound buffer.

## Parameters

<i>sound</i>	SFML <a href="#">Sound</a> for sound.
--------------	---------------------------------------

[setSound\(std::map<std::string, std::shared\\_ptr<sf::SoundBuffer>>, const std::string&\)](#): Initialize the sf::Sound of the class.

## Parameters

<i>mapSound</i>	Map of all the sound loaded.
<i>nameSound</i>	Name of the sound loaded.

**4.18.3.8 setVolume()**

```
void Sound::setVolume (
    float volume )
```

[setVolume\(float\)](#): Set the volume of the sound.

## Parameters

<i>volume</i>	Float number that represents the volume between 0 and 100 of the sound.

#### 4.24.1 Detailed Description

[Text](#) class: [Text](#) is a class that represents the text in the world.

The text class manages the text from an [Entity](#) using SFML.

#### 4.24.2 Constructor & Destructor Documentation

#### 4.24.2.1 Text()

```
Text::Text ( ) [inline]
```

< Bit of the [Text](#).

Default [Text](#) constructor.

Set the default value to "Default" and initialize the transform reference to null.

#### 4.24.2.2 ~Text()

```
Text::~Text ( ) [override], [default]
```

Default override [Text](#) destructor.

Set the default value to "Default".

### 4.24.3 Member Function Documentation

#### 4.24.3.1 draw()

```
void Text::draw (
    sf::RenderWindow & window ) const [override], [virtual]
```

[draw\(\)](#): Draw the [Text](#).

##### Parameters

<i>window</i>	SFML RenderWindow where the <a href="#">Text</a> will be drawn.
---------------	---

Implements [DrawableComponent](#).

#### 4.24.3.2 getBit()

```
int Text::getBit ( ) const
```

[getBit\(\)](#): Get the bit of the [Text](#).

##### Returns

int: The bit of the [Text](#).

#### 4.24.3.3 getColorFill()

```
Color Text::getColorFill ( ) const
```

`getColorFill()`: Get the fill color.

##### Returns

`Color`: Fill color of the text.

#### 4.24.3.4 getColorOutline()

```
Color Text::getColorOutline ( ) const
```

`getColorOutline()`: Get the outline color.

##### Returns

`Color`: Outline color of the text.

#### 4.24.3.5 getFont()

```
sf::Font Text::getFont ( ) const
```

`getFont()`: Get the Font.

##### Returns

`sf::Font`: Font of the `Text`.

#### 4.24.3.6 getSize()

```
int Text::getSize ( ) const
```

`getSize()`: Get the size.

##### Returns

`int`: int number that represents size of the text.

#### 4.24.3.7 getStringText()

```
std::string Text::getStringText ( ) const
```

[getStringText\(\)](#): Get the string.

##### Returns

std::string: String of the text.

#### 4.24.3.8 getText()

```
sf::Text Text::getText ( ) const
```

[getText\(\)](#): Get the [Text](#).

##### Returns

sf::Text: [Text](#) for draw.

#### 4.24.3.9 getTransform()

```
Transform * Text::getTransform ( ) [override], [virtual]
```

[getTransform\(\)](#): Get the reference to the component [Transform](#).

##### Returns

Transform\*: Reference of [Transform](#)

Implements [ITransform](#).

#### 4.24.3.10 init()

```
bool Text::init ( ) [override], [virtual]
```

[init\(\)](#): Initialize the component.

##### Returns

bool: true if the component is initialized, false otherwise

Implements [Components](#).

#### 4.24.3.11 setDeferredText()

```
void Text::setDeferredText (
    std::function< void()> setter )
```

[setDeferredText\(std::function<void\(\)>\)](#): Set the deferred text.

## Parameters

<i>setter</i>	Function that will set the text.
---------------	----------------------------------

**4.24.3.12 setFillColor()**

```
void Text::setFillColor (
    Color fillColor )
```

**setFillColor(Color)**: Set the fill color of [Text](#).

## Parameters

<i>fillColor</i>	<a href="#">Color</a> for the text.
------------------	-------------------------------------

**4.24.3.13 setFont()**

```
void Text::setFont (
    std::map< std::string, std::shared_ptr< sf::Font >> mapFont,
    const std::string & nameFont )
```

**setFont(std::map<std::string, std::shared\_ptr<sf::Font>>, const std::string&)**: Set the font of [Text](#).

## Parameters

<i>mapFont</i>	Map of all the font loaded.
<i>nameFont</i>	Name of the font loaded.

**4.24.3.14 setOutlineColor()**

```
void Text::setOutlineColor (
    Color outlineColor )
```

**setOutlineColor(Color)**: Set the outline color of [Text](#).

## Parameters

<i>outlineColor</i>	<a href="#">Color</a> for the border of the text.
---------------------	---

#### 4.24.3.15 setSize()

```
void Text::setSize (
    int sizeText )
```

[setSize\(int\)](#): Set the size of [Text](#).

##### Parameters

<i>sizeText</i>	Size of the text.
-----------------	-------------------

#### 4.24.3.16 setString()

```
void Text::setString (
    const std::string & newStringText )
```

[setString\(const std::string&\)](#): Set the string of [Text](#).

##### Parameters

<i>newStringText</i>	String text for draw.
----------------------	-----------------------

#### 4.24.3.17 setText() [1/2]

```
void Text::setText (
    std::map< std::string, std::shared_ptr< sf::Font >> mapFont,
    const std::string & nameFont,
    const std::string & newStringText,
    int sizeText,
    Color fillColor )
```

Sets the text of the component.

This function sets the [Text](#) of the component using the provided font map, the font name, a string for set the [Text](#), the size for the size of character and fill color for color the text.

##### Parameters

<i>mapFont</i>	Map of all the font loaded.
<i>nameFont</i>	Name of the font loaded.
<i>newStringText</i>	String text for draw.
<i>sizeText</i>	Size of the text.
<i>fillColor</i>	<a href="#">Color</a> for the text.

#### 4.24.3.18 setText() [2/2]

```
void Text::setText (
    std::map< std::string, std::shared_ptr< sf::Font >> mapFont,
    const std::string & nameFont,
    const std::string & newStringText,
    int sizeText,
    Color fillColor,
    Color outlineColor )
```

Sets the text of the component.

This function sets the [Text](#) of the component using the provided font map, the font name, a string for set the [Text](#), the size for the size of character, fill color for color the text and outline color for the border of the text.

##### Parameters

<i>mapFont</i>	Map of all the font loaded.
<i>nameFont</i>	Name of the font loaded.
<i>newStringText</i>	String text for draw.
<i>sizeText</i>	Size of the text.
<i>fillColor</i>	<a href="#">Color</a> for the text.
<i>outlineColor</i>	<a href="#">Color</a> for the border of the text.

#### 4.24.3.19 setTransform()

```
void Text::setTransform (
    Transform & newTransform )
```

[setTransform\(Transform&\)](#): Set the reference of the [Transform](#) component.

##### Parameters

<i>newTransform</i>	Reference of <a href="#">Transform</a> .
---------------------	--

#### 4.24.3.20 update()

```
void Text::update (
    sf::Time deltaTime ) [override], [virtual]
```

[update\(sf::Time\)](#): Update the component [Text](#)

##### Parameters

<i>timeDelta</i>	sf::Time of the game.
------------------	-----------------------

Implements [Components](#).

The documentation for this class was generated from the following files:

- src/Components/all\_components/include/Text.h
- src/Components/all\_components/Text.cpp

## 4.25 toSFML Class Reference

[toSFML](#) class: [toSFML](#) is a class that convert some class into SFML class.

```
#include <toSFML.h>
```

### Public Member Functions

- [toSFML](#) ()=default  
*Default [toSFML](#) constructor.*
- [~toSFML](#) ()=default  
*[toSFML](#) destructor.*
- template<typename T >  
sf::Rect< T > [toSFMLRect](#) ([Rect](#)< T > rect)  
*[toSFMLRect](#)(): Convert your Rect<T> into sf::Rect<T>.*

### 4.25.1 Detailed Description

[toSFML](#) class: [toSFML](#) is a class that convert some class into SFML class.

Convert some class in SFML class.

### 4.25.2 Constructor & Destructor Documentation

#### 4.25.2.1 toSFML()

```
toSFML::toSFML ( ) [default]
```

Default [toSFML](#) constructor.

Parameters

<i>void</i>	
-------------	--

**Returns**

void

**4.25.2.2 ~toSFML()**

```
toSFML::~~toSFML ( ) [default]
```

[toSFML](#) destructor.

**Parameters**

<i>void</i>	
-------------	--

**Returns**

void

**4.25.3 Member Function Documentation****4.25.3.1 toSFMLRect()**

```
template<typename T >
template sf::Rect< float > toSFML::toSFMLRect (
    Rect< T > rect )
```

[toSFMLRect\(\)](#): Convert your Rect<T> into sf::Rect<T>.

**Template Parameters**

<i>T</i>	Type of the rect.
----------	-------------------

**Parameters**

<i>rect</i>	The rect you want to convert.
-------------	-------------------------------

**Returns**

sf::Rect<T>: SFML rect.

The documentation for this class was generated from the following files:

- src/toSFML/include/toSFML.h
- src/toSFML/toSFML.cpp

## 4.26 Transform Class Reference

**Transform** class: **Transform** is a class that represents the transform of a Component.

```
#include <Transform.h>
```

Inheritance diagram for Transform:

Collaboration diagram for Transform:

### Public Member Functions

- **Transform** ()  
*Default **Transform** constructor.*
- bool **init** () override  
***init**(): Initialize the component*
- **~Transform** () override=default  
***Transform** destructor.*
- void **update** (sf::Time deltaTime) override

- *update(sf::Time): Update the component [Music](#)*
- int [getBit](#) () override
  - getBit(): Get the bitmask of the component*
- [Vector2](#)< float > [getPosition](#) () const
  - getPositionVector(): Get the position vector of the component;*
- float [getRotation](#) () const
  - getRotationVector(): Get the rotation vector of the component;*
- [Vector2](#)< float > [getScale](#) () const
  - getScaleVector(): Get the scale vector of the component;*
- TransformStruct [getTransform](#) () const
  - getTransform(): Get the the transform of the component;*
- void [setTransform](#) ([Vector2](#)< float > newPosition, float newRotation, [Vector2](#)< float > newScale)
  - setTransform(): Set the transform of the component;*
- void [setPosition](#) ([Vector2](#)< float > newPosition)
  - setPosition(): Set the transform position of the component;*
- void [setRotation](#) (float newRotation)
  - setRotation(): Set the transform rotation of the component;*
- void [setScale](#) ([Vector2](#)< float > newScale)
  - setScale(): Set the transform scale of the component;*
- void [setDeferredTransform](#) (const std::function< void()> &setter)
  - setDeferredSprite(): Set the deferred sprite.*
- void [applyDeferredTransform](#) ()
  - applyDeferredSprite(): Apply the deferred sprite.*

### 4.26.1 Detailed Description

[Transform](#) class: [Transform](#) is a class that represents the transform of a Component.

The [Transform](#) class manages the position, rotation and scale of a Component.

### 4.26.2 Constructor & Destructor Documentation

#### 4.26.2.1 Transform()

```
Transform::Transform ( ) [inline]
```

Default [Transform](#) constructor.

Parameters

<i>void</i>	
-------------	--

Returns

void

#### 4.26.2.2 ~Transform()

```
Transform::~Transform ( ) [override], [default]
```

[Transform](#) destructor.

##### Parameters

<i>void</i>	
-------------	--

##### Returns

void

### 4.26.3 Member Function Documentation

#### 4.26.3.1 applyDeferredTransform()

```
void Transform::applyDeferredTransform ( )
```

[applyDeferredSprite\(\)](#): Apply the deferred sprite.

##### Parameters

<i>void</i>	
-------------	--

##### Returns

void

#### 4.26.3.2 getBit()

```
int Transform::getBit ( ) [override], [virtual]
```

[getBit\(\)](#): Get the bitmask of the component

##### Parameters

<i>void</i>	
-------------	--

##### Returns

int: bitmask of the component

Implements [Components](#).

#### 4.26.3.3 getPosition()

```
Vector2< float > Transform::getPosition ( ) const
```

getPositionVector(): Get the position vector of the component;

##### Parameters

<i>void</i>	
-------------	--

##### Returns

std::vector<float>: position vector of the component

#### 4.26.3.4 getRotation()

```
float Transform::getRotation ( ) const
```

getRotationVector(): Get the rotation vector of the component;

##### Parameters

<i>void</i>	
-------------	--

##### Returns

std::vector<float>: rotation vector of the component

#### 4.26.3.5 getScale()

```
Vector2< float > Transform::getScale ( ) const
```

getScaleVector(): Get the scale vector of the component;

##### Parameters

<i>void</i>	
-------------	--

**Returns**

std::vector<float>: scale vector of the component

**4.26.3.6 getTransform()**

```
Transform::TransformStruct Transform::getTransform ( ) const
```

[getTransform\(\)](#): Get the the transform of the component;

**Parameters**

<i>void</i>	
-------------	--

**Returns**

TransformStruct: struct of the [Transform](#).

**4.26.3.7 init()**

```
bool Transform::init ( ) [override], [virtual]
```

[init\(\)](#): Initialize the component

**Parameters**

<i>void</i>	
-------------	--

**Returns**

bool: true if the component is initialized, false otherwise

Implements [Components](#).

**4.26.3.8 setDeferredTransform()**

```
void Transform::setDeferredTransform (
    const std::function< void()> & setter )
```

[setDeferredSprite\(\)](#): Set the deferred sprite.

**Parameters**

<i>setter</i>	Function that will set the sprite.
---------------	------------------------------------

**Returns**

void

**4.26.3.9 setPosition()**

```
void Transform::setPosition (
    Vector2< float > newPosition )
```

[setPosition\(\)](#): Set the transform position of the component;

**Parameters**

<i>newPosition</i>	: the new <a href="#">Vector2&lt;float&gt;</a> position.
--------------------	--

**Returns**

void

**4.26.3.10 setRotation()**

```
void Transform::setRotation (
    float newRotation )
```

[setRotation\(\)](#): Set the transform rotation of the component;

**Parameters**

<i>newRotation</i>	: the new float rotation.
--------------------	---------------------------

**Returns**

void

**4.26.3.11 setScale()**

```
void Transform::setScale (
    Vector2< float > newScale )
```

[setScale\(\)](#): Set the transform scale of the component;

## Parameters

<i>newScale</i>	: the new <a href="#">Vector2&lt;float&gt;</a> scale.
-----------------	---

## Returns

void

**4.26.3.12 setTransform()**

```
void Transform::setTransform (
    Vector2< float > newPosition,
    float newRotation,
    Vector2< float > newScale )
```

[setTransform\(\)](#): Set the transform of the component;

## Parameters

<i>newPosition</i>	: the new <a href="#">Vector2&lt;float&gt;</a> position.
<i>newRotation</i>	: the new float rotation.
<i>newScale</i>	: the new <a href="#">Vector2&lt;float&gt;</a> scale.

## Returns

void

**4.26.3.13 update()**

```
void Transform::update (
    sf::Time deltaTime ) [override], [virtual]
```

[update\(sf::Time\)](#): Update the component [Music](#)

## Parameters

<i>timeDelta</i>	sf::Time of the game.
------------------	-----------------------

Implements [Components](#).

The documentation for this class was generated from the following files:

- src/Components/all\_components/include/Transform.h
- src/Components/all\_components/Transform.cpp

## 4.27 TransformTest Class Reference

Inheritance diagram for TransformTest:

Collaboration diagram for TransformTest:

### Protected Member Functions

- void **SetUp** () override
- void **TearDown** () override

### Protected Attributes

- [Transform](#) transform

The documentation for this class was generated from the following file:

- tests/Components/all\_components/TestTransform.cpp

## 4.28 Vector2< T > Class Template Reference

Vector class: Vector is a class that represents a vector in 2 dimensions.

```
#include <Vector2.h>
```

### Public Member Functions

- [Vector2](#) ()  
*< Variable for using the value of the Vector2Struct.*
- [Vector2](#) (T x, T y)  
*Vector2 constructor with parameters.*
- [~Vector2](#) ()=default  
*Vector2 destructor.*
- Vector2Struct [getVector2Struct](#) () const  
*getVector2Struct(): Get the using Vector2Struct.*
- T [getX](#) () const  
*getX(): Get x of Vector2Struct.*
- T [getY](#) () const  
*getY(): Get y of Vector2Struct.*
- void [setX](#) (T newX)  
*setX(): Set x of Vector2Struct.*
- void [setY](#) (T newY)  
*setY(): Set y of Vector2Struct.*

### 4.28.1 Detailed Description

```
template<typename T>
class Vector2< T >
```

Vector class: Vector is a class that represents a vector in 2 dimensions.

This create a vector with 2 value.

### 4.28.2 Constructor & Destructor Documentation

#### 4.28.2.1 Vector2() [1/2]

```
template<typename T >
Vector2< T >::Vector2 ( ) [inline]
```

< Variable for using the value of the Vector2Struct.

[Vector2](#) constructor with parameters.

### Template Parameters

<i>T</i>	Type of the vector.
----------	---------------------

### Parameters

<i>x</i>	Position x.
<i>y</i>	Position y.

### Returns

void

#### 4.28.2.2 **Vector2()** [2/2]

```
template<typename T >
Vector2< T >::Vector2 (
    T x,
    T y ) [inline]
```

[Vector2](#) constructor with parameters.

### Template Parameters

<i>T</i>	Type of the vector.
----------	---------------------

### Parameters

<i>x</i>	Position x.
<i>y</i>	Position y.

### Returns

void

#### 4.28.2.3 **~Vector2()**

```
template<typename T >
Vector2< T >::~~Vector2 ( ) [default]
```

[Vector2](#) destructor.

## Template Parameters

<i>T</i>	Type of the vector.
----------	---------------------

## Parameters

<i>void</i>	
-------------	--

## Returns

void

### 4.28.3 Member Function Documentation

#### 4.28.3.1 `getVector2Struct()`

```
template<typename T >
template Vector2< int >::Vector2Struct Vector2< T >::getVector2Struct ( ) const
```

`getVector2Struct()`: Get the using Vector2Struct.

## Parameters

<i>void</i>	
-------------	--

## Returns

Vector2Struct

#### 4.28.3.2 `getX()`

```
template<typename T >
template int Vector2< T >::getX ( ) const
```

`getX()`: Get x of Vector2Struct.

## Template Parameters

--	--

**4.28.3.3 getY()**

```
template<typename T >
template int Vector2< T >::getY ( ) const
```

**getY()**: Get y of Vector2Struct.

**Template Parameters**

--	--

**4.28.3.4 setX()**

```
template<typename T >
template void Vector2< T >::setX (
    T newX )
```

**setX()**: Set x of Vector2Struct.

**Template Parameters**

<i>T</i>	Type of the <a href="#">Vector2</a>
----------	-------------------------------------

**Parameters**

<i>newX</i>	The new value of x.
-------------	---------------------

**4.28.3.5 setY()**

```
template<typename T >
template void Vector2< T >::setY (
    T newY )
```

**setY()**: Set y of Vector2Struct.

**Template Parameters**

<i>T</i>	Type of the <a href="#">Vector2</a>
----------	-------------------------------------

**Parameters**

<i>newY</i>	The new value of y.
-------------	---------------------

The documentation for this class was generated from the following files:

- `src/Other/include/Vector2.h`
- `src/Other/Vector2.cpp`

## 4.29 World Class Reference

`World` class: `World` is a class that represents the world of the game.

```
#include <world.h>
```

Inheritance diagram for `World`:

Collaboration diagram for World:

## Public Member Functions

- [World](#) ()=default  
*Default [World](#) constructor.*
- [~World](#) () override=default  
*[World](#) destructor.*
- bool [init](#) () override  
*[initEntityManager\(\)](#): Initialize the [EntityManager](#).*
- void [createEntities](#) (std::map< std::string, std::pair< std::unique\_ptr< [EntityManager](#) >, std::vector< std::string >>> &mapEntityManager)  
*[createEntities\(\)](#): Create the entities.*
- [EntityManager](#) & [addEntityManager](#) (const std::string &NameEntityManager)  
*[addEntityManager\(\)](#): Add an entity manager to the map.*
- [EntityManager](#) & [getEntityManager](#) (const std::string &NameEntityManager)  
*[getEntityManager\(\)](#): Get the entity manager.*
- void [setNameWorld](#) (std::string newName)  
*[setNameWorld\(\)](#): Set the name of the world.*
- std::string [getNameWorld](#) () const  
*[getNameWorld\(\)](#): Get the name of the world.*
- std::map< std::string, [EntityManager](#) \* > [getEntityManagerMap](#) () const  
*[getEntityManagerMap\(\)](#): Get the map of the entity manager.*
- std::map< std::string, [EntityManager](#) \* > [getEntitiesManager](#) () const  
*[getEntitiesManager\(\)](#): Get the entities*

## Additional Inherited Members

### 4.29.1 Detailed Description

[World](#) class: [World](#) is a class that represents the world of the game.

The [World](#) class manages the world of the game.

### 4.29.2 Constructor & Destructor Documentation

#### 4.29.2.1 World()

```
World::World ( ) [default]
```

Default [World](#) constructor.

##### Parameters

<i>void</i>	
-------------	--

##### Returns

void

#### 4.29.2.2 ~World()

```
World::~World ( ) [override], [default]
```

[World](#) destructor.

##### Parameters

<i>void</i>	
-------------	--

##### Returns

void

### 4.29.3 Member Function Documentation

#### 4.29.3.1 addEntityManager()

```
EntityManager & World::addEntityManager (
    const std::string & NameEntityManager )
```

[addEntityManager\(\)](#): Add an entity manager to the map.

##### Parameters

<i>NameEntityManager</i>	Name of the entity manager.
--------------------------	-----------------------------

##### Returns

[EntityManager&](#): The entity manager.

#### 4.29.3.2 createEntities()

```
void World::createEntities (
    std::map< std::string, std::pair< std::unique_ptr< EntityManager >, std::vector<
std::string >>> & mapEntityManager )
```

[createEntities\(\)](#): Create the entities.

##### Parameters

<i>mapEntityManager</i>	Map of the entities manager's unique pointers.
<i>keyEntityManager</i>	Key of the entities manager.

##### Returns

void

#### 4.29.3.3 getEntitiesManager()

```
std::map< std::string, EntityManager * > World::getEntitiesManager ( ) const
```

[getEntitiesManager\(\)](#): Get the entities

##### Returns

std::map<std::string, EntityManager\*>: Get the entities.

#### 4.29.3.4 getEntityManager()

```
EntityManager & World::getEntityManager (
    const std::string & NameEntityManager )
```

[getEntityManager\(\)](#): Get the entity manager.

## Parameters

<i>NameEntityManager</i>	Name of the entity manager.
--------------------------	-----------------------------

## Returns

[EntityManager](#)&: The entity manager.

**4.29.3.5 getEntityManagerMap()**

```
std::map< std::string, EntityManager * > World::getEntityManagerMap ( ) const
```

[getEntityManagerMap\(\)](#): Get the map of the entity manager.

## Parameters

<i>void</i>	
-------------	--

## Returns

`std::map<std::string, EntityManager*>`: The map of the entity manager.

**4.29.3.6 getNameWorld()**

```
std::string World::getNameWorld ( ) const
```

[getNameWorld\(\)](#): Get the name of the world.

## Parameters

<i>void</i>	
-------------	--

## Returns

`std::string`: The name of the world.

**4.29.3.7 init()**

```
bool World::init ( ) [override], [virtual]
```

[initEntityManager\(\)](#): Initialize the [EntityManager](#).

**Parameters**

<i>void</i>	
-------------	--

**Returns**

bool: true if the [EntityManager](#) is initialized, false otherwise.

Reimplemented from [EntityManager](#).

**4.29.3.8 setNameWorld()**

```
void World::setNameWorld (
    std::string newName )
```

[setNameWorld\(\)](#): Set the name of the world.

**Parameters**

<i>newName</i>	New name of the world.
----------------	------------------------

**Returns**

void

The documentation for this class was generated from the following files:

- src/World/include/world.h
- src/World/world.cpp
