Chapter 1

Engine

1.1 Install package(s)

1.1.1 Debian

- Install the following zip file: debian.zip
- · Unzip the package
- Install the package with the following command:

```
cd deb-package
sudo dpkg -i quantumvortex-engine_1.0.0-1_amd64.deb
```

1.1.2 Fedora 38

- Install the following zip file: fedora.zip
- · Unzip the package
- Install the package with the following command:

```
cd rpm-package-fedora-38 sudo dnf install quantumvortex-engine-fedora38.rpm \,
```

1.1.3 Fedora Latest

- Install the following zip file: fedora.zip
- · Unzip the package
- · Install the package with the following command:

```
\begin{tabular}{ll} $\tt cd rpm-package-fedora-latest \\ &\tt sudo dnf install quantumvortex-engine-fedora-latest.rpm \\ \end{tabular}
```

Engine

1.2 Compilation

1.2.1 Linux

Use the following command to compile the engine:

cmake -Bbuild make -Cbuild

Use the following command to compile the engine and its tests: $\tt cmake -Bbuild -DBUILD_TESTS=ON$ $\tt make -Cbuild$

Use the following command for create the package (.tgz or .zip) after compile:

cpack

Documentation

1.3.1 PDF

Here you can see the documentation in PDF format: R-Type_Engine

Chapter 2

Hierarchical Index

2.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

| Archetypes |
|-------------------|
| Color |
| Components |
| Entity |
| EntityManager |
| World |
| GameEngine |
| Music |
| Sound |
| Transform |
| Sprite |
| Text |
| DrawableComponent |
| Sprite |
| Text |
| EventEngine |
| GameEngine |
| ITransform |
| Sprite |
| Text |
| Rect < T > |
| Rect< float > |
| Script |
| testing::Test |
| EntityManagerTest |
| EntityTest |
| EventTest |
| GameEngineTest |
| MusicTests |
| SoundTest |
| SpriteTest |
| TestColor |
| TestRect |
| TestVector2 |

Hierarchical Index

| TestWorld | | | | | | | | | | | | | | | | | | | | | | | 95 |
|-------------------|--|--|--|--|--|------|--|--|--|--|--|------|--|--|--|------|--|--|--|--|--|-----|----|
| TesttoSFML . | | | | | | | | | | | | | | | | | | | | | | | 93 |

Chapter 3

Class Index

3.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

| Archetypes | 7 |
|---|----|
| Color | |
| Color class: Color is a class that use for the color in game | 7 |
| Components | |
| Components class: Components is a class that represents a component in the game | 13 |
| DrawableComponent | |
| DrawableComponent class: DrawableComponent is a class that represents a drawable compo- | |
| nent in the game | 16 |
| Entity | |
| Entity class: Entity is a class that represents an entity in the game | 18 |
| EntityManager | 29 |
| EntityManagerTest | 33 |
| EntityTest | 35 |
| EventEngine | |
| EventEngine class: EventEngine is a class that represents the event engine of the game | 36 |
| EventTest | 41 |
| GameEngine | |
| GameEngine class: GameEngine is a class that represents the game engine | 42 |
| GameEngineTest | 57 |
| ITransform | |
| ITransform class: ITransform is a class that represents an interface of the Component Transform | 59 |
| Music | |
| Music class: Music is a class that represents the music in the world | 60 |
| MusicTests | 68 |
| Rect < T > | |
| Rect class: Rect is a class that represents a rectangle | 69 |
| Script | 73 |
| Sound | |
| Sound class: Sound is a class that represents the sound properties of a Component | 74 |
| SoundTest | 82 |
| Sprite | |
| Sprite class: Sprite is a class that represents the rendering properties of a Component | 83 |
| SpriteTest | 90 |
| TestColor | 91 |
| TestRect | 92 |

6 Class Index

| esttoSFML | 93 |
|--|----|
| estVector2 | 94 |
| estWorld | 95 |
| ext | |
| Text class: Text is a class that represents the text in the world | 96 |
| extTest |)7 |
| ToSFML class: toSFML is a class that convert some class into SFML class | 38 |
| ransform | |
| Transform class: Transform is a class that represents the transform of a Component | 10 |
| ransformTest | |
| Vector class: Vector is a class that represents a vector in 2 dimensions | 20 |
| Vorld | |
| World class: World is a class that represents the world of the game | 24 |

Chapter 4

Class Documentation

4.1 Archetypes Class Reference

The documentation for this class was generated from the following file:

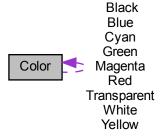

• src/Archetype/include/Archetypes.h

4.2 Color Class Reference

Color class: Color is a class that use for the color in game.

#include <Color.h>

Collaboration diagram for Color:

Public Member Functions

```
• Color ()
```

< Represent the Alpha of a color between 0 and 255.

Color (const sf::Color &sfmlColor)

Color constructor with sf::Color& as parameter.

∼Color ()=default

Default override Color destructor.

• sf::Uint8 getRed () const

getRed(): Get the sf::Uint8 red.

· sf::Uint8 getGreen () const

getGreen(): Get the sf::Uint8 green.

sf::Uint8 getBlue () const

getBlue(): Get the sf::Uint8 blue.

• sf::Uint8 getAlpha () const

getAlpha(): Get the sf::Uint8 alpha.

void setRed (int newRed)

setRed(int): Set the sf::Uint8 red with an int and convert into sf::Unit8 in the function.

• void setGreen (int newGreen)

setGreen(int): Set the sf::Uint8 green with an int and convert into sf::Unit8 in the function.

void setBlue (int newBlue)

setBlue(int): Set the sf::Uint8 blue with an int and convert into sf::Unit8 in the function.

void setAlpha (int newAlpha)

setAlpha(int): Set the sf::Uint8 alpha with an int and convert into sf::Unit8 in the function.

operator sf::Color () const

operator sf::Color() const: Convert Color classes into sf::Color

Static Public Member Functions

static Color fromSFMLColor (const sf::Color &sfColor)

fromSFMLColor(const sf::Color&): Convert SFML color into Color class.

Static Public Attributes

- static const Color Black = Color::fromSFMLColor(sf::Color::Black)
- static const Color White = Color::fromSFMLColor(sf::Color::White)
- static const Color Red = Color::fromSFMLColor(sf::Color::Red)
- static const Color Green = Color::fromSFMLColor(sf::Color::Green)
- static const Color Blue = Color::fromSFMLColor(sf::Color::Blue)
- static const Color **Yellow** = Color::fromSFMLColor(sf::Color::Yellow)

static const Color Cyan = Color::fromSFMLColor(sf::Color::Cyan)

- static const Color Magenta = Color::fromSFMLColor(sf::Color::Magenta)
- static const Color **Transparent** = Color::fromSFMLColor(sf::Color::Transparent)

4.2.1 Detailed Description

Color class: Color is a class that use for the color in game.

The Color class manages the color.

4.2 Color Class Reference 9

4.2.2 Constructor & Destructor Documentation

4.2.2.1 Color() [1/2]

```
Color::Color ( ) [inline]
```

< Represent the Alpha of a color between 0 and 255.

Default Color constructor.

Set the default value to "Default" and initialize red, green, blue and alpha to 255 for initialize the color white.

Parameters

void

Returns

void

4.2.2.2 Color() [2/2]

Color constructor with sf::Color& as parameter.

Parameters

| sfmlColor | Represent a color preset or no from SFML. |
|-----------|---|
|-----------|---|

Returns

void

4.2.2.3 ∼Color()

```
Color::~Color ( ) [default]
```

Default override Color destructor.

| D _o | | | - 4 | | |
|----------------|----|---|-----|---|----|
| Pа | ra | m | eı | e | rs |

void

Returns

void

4.2.3 Member Function Documentation

4.2.3.1 fromSFMLColor()

fromSFMLColor(const sf::Color&): Convert SFML color into Color class.

Parameters

| sfColor | The color from SFML |
|---------|---------------------|
|---------|---------------------|

Returns

Color: Color class.

4.2.3.2 getAlpha()

```
sf::Uint8 Color::getAlpha ( ) const
```

getAlpha(): Get the sf::Uint8 alpha.

Parameters

Returns

sf::Uint8: The value of alpha.

4.2 Color Class Reference

4.2.3.3 getBlue()

```
sf::Uint8 Color::getBlue ( ) const

getBlue(): Get the sf::Uint8 blue.

Parameters

void
```

Returns

sf::Uint8: The value of blue.

4.2.3.4 getGreen()

```
sf::Uint8 Color::getGreen ( ) const
getGreen(): Get the sf::Uint8 green.
Parameters
```

Returns

void

sf::Uint8: The value of green.

4.2.3.5 getRed()

```
sf::Uint8 Color::getRed ( ) const
getRed(): Get the sf::Uint8 red.
```

Parameters

void

Returns

sf::Uint8: The value of red.

4.2.3.6 operator sf::Color()

```
Color::operator sf::Color ( ) const [explicit]
```

operator sf::Color() const: Convert Color classes into sf::Color

Parameters

void

Returns

sf::Color: Get the Color in sf::Color

4.2.3.7 setAlpha()

setAlpha(int): Set the sf::Uint8 alpha with an int and convert into sf::Unit8 in the function.

Parameters

newAlpha

Returns

void

4.2.3.8 setBlue()

setBlue(int): Set the sf::Uint8 blue with an int and convert into sf::Unit8 in the function.

Parameters

newBlue

Returns

void

4.2.3.9 setGreen()

setGreen(int): Set the sf::Uint8 green with an int and convert into sf::Unit8 in the function.

Parameters

newGreen

Returns

void

4.2.3.10 setRed()

setRed(int): Set the sf::Uint8 red with an int and convert into sf::Unit8 in the function.

Parameters

| newRed | Number between 0 and 255. |
|----------|------------------------------|
| HIEWHIEU | Mullibel betweell 0 and 255. |

Returns

void

The documentation for this class was generated from the following files:

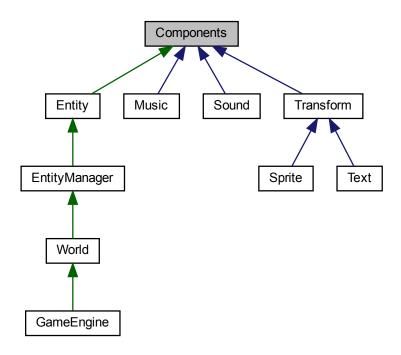

- src/Other/include/Color.h
- src/Other/Color.cpp

4.3 Components Class Reference

Components class: Components is a class that represents a component in the game.

```
#include <Components.h>
```

Inheritance diagram for Components:

Public Member Functions

• Components ()=default

Default Components constructor.

virtual ∼Components ()=default

Components destructor.

• virtual bool init ()=0

init(): Initialize the component

virtual int getBit ()=0

getBit(): Get the bitmask of the component

• virtual void update (sf::Time timeDelta)=0

update(): Update the component

4.3.1 Detailed Description

Components class: Components is a class that represents a component in the game.

Components are the building blocks of the game. They are attached to entities and define their behavior.

4.3.2 Constructor & Destructor Documentation

4.3.2.1 Components()

Components::Components () [default]

Default Components constructor.

Parameters

void

Returns

void

4.3.2.2 \sim Components()

virtual Components::~Components () [virtual], [default]

Components destructor.

Parameters

void

Returns

void

4.3.3 Member Function Documentation

4.3.3.1 getBit()

virtual int Components::getBit () [pure virtual]

getBit(): Get the bitmask of the component

Parameters

void

Returns

int: bitmask of the component

Implemented in Entity, Transform, Text, Sprite, Sound, and Music.

4.3.3.2 init()

```
virtual bool Components::init ( ) [pure virtual]
```

init(): Initialize the component

Parameters

Returns

bool: true if the component is initialized, false otherwise

Implemented in World, EntityManager, Entity, Transform, Text, Sprite, Sound, and Music.

4.3.3.3 update()

update(): Update the component

Parameters

| timeDelta | time elapsed since the last update |
|-----------|------------------------------------|
|-----------|------------------------------------|

Returns

void

Implemented in Sound, Music, Entity, Transform, Text, and Sprite.

The documentation for this class was generated from the following file:

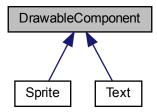

• src/Components/include/Components.h

4.4 DrawableComponent Class Reference

DrawableComponent class: DrawableComponent is a class that represents a drawable component in the game.

#include <DrawableComponent.h>

Inheritance diagram for DrawableComponent:

Public Member Functions

- virtual \sim DrawableComponent ()=default
 - Default DrawableComponent constructor.
- virtual void draw (sf::RenderWindow &window) const =0

draw(): Draw the component

4.4.1 Detailed Description

DrawableComponent class: DrawableComponent is a class that represents a drawable component in the game.

DrawableComponents are components that can be drawn on the screen.

4.4.2 Constructor & Destructor Documentation

4.4.2.1 ∼DrawableComponent()

Default DrawableComponent constructor.

Parameters

void

Returns

void

4.4.3 Member Function Documentation

4.4.3.1 draw()

draw(): Draw the component

Parameters

| window | Window to draw the component on |
|--------|---------------------------------|
|--------|---------------------------------|

Returns

void

Implemented in Text, and Sprite.

The documentation for this class was generated from the following file:

• src/Components/include/DrawableComponent.h

4.5 Entity Class Reference

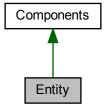

Entity class: Entity is a class that represents an entity in the game.

```
#include <entity.h>
```

Inheritance diagram for Entity:

Collaboration diagram for Entity:

Public Member Functions

- Entity ()
 - Default Entity constructor.
- Entity (const std::string &nameEntity, Archetypes newArchetype=Archetypes())
 - Entity constructor.
- ∼Entity () override=default

```
Entity destructor.
• int getBit () override
      getBit(): Get the bit of the Sprite.
· bool init () override
     init(): Initialize the entity

    std::string getName () const

     genName(): Get the name of the entity

    void setName (std::string newName)

      setName(): Set the name of the entity

    void update (sf::Time deltaTime) override

      update(sf::Time): Update the component Music

    void addDrawable (Components *component)

      addDrawable(): Add a drawable component to the entity

    void removeDrawable (Components *component)

      removeDrawable(): Remove a drawable component to the entity
• void drawEntity (sf::RenderWindow &window)
      drawEntity(): Draw the entities
• template<typename T , typename... TArgs>
  T & addComponent (TArgs &&... args)
      addComponent(): Add a component to the entity

    template<typename T >

  bool removeComponent ()
      removeComponent(): Remove a component to the entity
• template<typename T >
  T & getComponent ()
      getComponent(): Get a component from the entity

    template<typename T >

  std::size_t getComponentTypeID () noexcept
      getComponentTypeID(): Get a component ID from the entity

    std::bitset< 6 > getComponentBitset () const

      getComponentBitset(): Get all components bitset from the entity

    std::vector < DrawableComponent * > getDrawableComponents () const

      getDrawableComponents(): Get all the drawable components from the entity

    std::array< Components *, 6 > getComponentArrays () const

     getComponentArrays(): Get all the components from the entity
• void setActive (bool isActive)
     setActive(bool): Set the value active for using entity or not
• bool getActive () const
      getActive(): Get the value active for knowing if entity is using or not.

    void setDeferredEntity (std::function < void() > setter)

      setDeferredEntity(std::function<void()>): Set the deferred entity.

    void applyDeferredEntity ()

      setDeferredEntity(std::function<void()>): Set the deferred entity.
```

Additional Inherited Members

4.5.1 Detailed Description

Entity class: Entity is a class that represents an entity in the game.

The Entity class manages components associated with the entity.

4.5.2 Constructor & Destructor Documentation

4.5.2.1 Entity() [1/2]

```
Entity::Entity ( ) [inline]
```

Default Entity constructor.

Parameters

Returns

void

4.5.2.2 Entity() [2/2]

Entity constructor.

Parameters

| nameEntity | name of the entity |
|--------------|---|
| newArchetype | archetype of the entity (optional, default = new archetype) |

Returns

void

4.5.2.3 \sim Entity()

```
Entity::~Entity ( ) [override], [default]
```

Entity destructor.

Parameters

void

Returns

void

4.5.3 Member Function Documentation

4.5.3.1 addComponent()

addComponent(): Add a component to the entity

Template Parameters

| T | Type of the component |
|-------|--|
| TArgs | Variadic template for component constructor arguments. |

Parameters

| args | arguments of the component |
|------|----------------------------|
|------|----------------------------|

Returns

T&: reference of the component

4.5.3.2 addDrawable()

addDrawable(): Add a drawable component to the entity

Parameters

| component | component to add |
|-----------|------------------|

Returns

void

4.5.3.3 applyDeferredEntity()

```
void Entity::applyDeferredEntity ( )
```

setDeferredEntity(std::function<void()>): Set the deferred entity.

Parameters

setter Function that will set the entity.

Returns

void

4.5.3.4 drawEntity()

drawEntity(): Draw the entities

Parameters

| window | window where the entities are drawn |
|--------|-------------------------------------|
|--------|-------------------------------------|

Returns

void

4.5.3.5 getActive()

```
bool Entity::getActive ( ) const
```

getActive(): Get the value active for knowing if entity is using or not.

Parameters

void

Returns

bool: True if the engine use this entity, false otherwise.

4.5.3.6 getBit()

```
int Entity::getBit ( ) [override], [virtual]
getBit(): Get the bit of the Sprite.
```

Parameters

Returns

int: The bit of the Sprite.

Implements Components.

4.5.3.7 getComponent()

```
template<typename T >
template Text & Entity::getComponent< Text > ( )
```

getComponent(): Get a component from the entity

Template Parameters

Parameters

Returns

T&: reference of the component

4.5.3.8 getComponentArrays()

```
std::array< Components *, 6 > Entity::getComponentArrays ( ) const
```

getComponentArrays(): Get all the components from the entity

Parameters

void

Returns

```
std::array<Components*, 6>: array of components
```

4.5.3.9 getComponentBitset()

```
std::bitset< 6 > Entity::getComponentBitset ( ) const
getComponentBitset(): Get all components bitset from the entity
Parameters
void
```

Returns

std::bitset<6>: bitset of the components

4.5.3.10 getComponentTypeID()

```
template<typename T >
template std::size_t Entity::getComponentTypeID< Text > ( ) [noexcept]
```

getComponentTypeID(): Get a component ID from the entity

Template Parameters

Parameters

void

Returns

std::size_t: id of the component

4.5.3.11 getDrawableComponents()

```
{\tt std::vector} < {\tt DrawableComponent} \ * \ > \ {\tt Entity::getDrawableComponents} \ (\ ) \ \ {\tt const} {\tt getDrawableComponents} () : \ {\tt Get\ all\ the\ drawable\ components\ from\ the\ entity}
```

| ь. | | | | | |
|----|----|---|----|----|----|
| Pа | ra | m | eı | ıе | rs |

Returns

std::vector<DrawableComponent*>: drawable components of the entity

4.5.3.12 getName()

```
std::string Entity::getName ( ) const
```

genName(): Get the name of the entity

Parameters

Returns

std::string: name of the entity

4.5.3.13 init()

```
bool Entity::init ( ) [override], [virtual]
```

init(): Initialize the entity

Parameters

Returns

bool: true if the entity is initialized, false otherwise

Implements Components.

Reimplemented in World, and EntityManager.

4.5.3.14 removeComponent()

```
template<typename T > template bool Entity::removeComponent< Text > ( )
```

removeComponent(): Remove a component to the entity

Template Parameters

T Type of the component

Returns

T&: reference of the component

4.5.3.15 removeDrawable()

removeDrawable(): Remove a drawable component to the entity

Parameters

component | component to remove

Returns

void

4.5.3.16 setActive()

setActive(bool): Set the value active for using entity or not

Parameters

isActive True or false;

Returns

void

4.5.3.17 setDeferredEntity()

```
void Entity::setDeferredEntity ( {\tt std::function} < {\tt void}() > {\tt setter} \ )
```

setDeferredEntity(std::function<void()>): Set the deferred entity.

Parameters

setter Function that will set the entity.

Returns

void

4.5.3.18 setName()

setName(): Set the name of the entity

Parameters

newName new name of the entity

Returns

void

4.5.3.19 update()

update(sf::Time): Update the component Music

Parameters

timeDelta sf::Time of the game.

Returns

void

Implements Components.

The documentation for this class was generated from the following files:

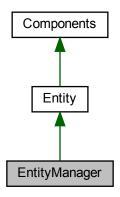

- src/Entity/include/entity.h
- src/Entity/entity.cpp

4.6 EntityManager Class Reference

Inheritance diagram for EntityManager:

Collaboration diagram for EntityManager:

Public Member Functions

• EntityManager ()=default

Default EntityManager constructor.

• \sim EntityManager () override=default

EntityManager destructor.

• bool init () override

initEntityManager(): Initialize the EntityManager.

• Entity & addEntity (const std::string &nameEntity, Archetypes newArchetype=Archetypes())

addEntity(): Create and add a new entity to the entity manager.

• Entity & getEntity (const std::string &nameEntity)

getEntity(): Get an entity from the entity manager by its name.

std::map< std::string, Entity * > getEntities () const

getEntities(): Get the EntityManager's entities.

std::map< std::string, Entity * > getEntityMap () const

getEntityMap(): Get the EntityManager's entity map.

Additional Inherited Members

4.6.1 Constructor & Destructor Documentation

4.6.1.1 EntityManager()

EntityManager::EntityManager () [default]

Default EntityManager constructor.

Parameters

void

Returns

void

4.6.1.2 ∼EntityManager()

```
EntityManager::~EntityManager ( ) [override], [default]
```

EntityManager destructor.

Parameters

void

Returns

void

4.6.2 Member Function Documentation

4.6.2.1 addEntity()

addEntity(): Create and add a new entity to the entity manager.

Template Parameters

| T | Type of the entity. | |
|-------|------------------------|--|
| TArgs | Type of the arguments. | |

Parameters

| args | Arguments of the entity. |
|------|--------------------------|

4.6.2.2 getEntities()

```
std::map< std::string, Entity * > EntityManager::getEntities ( ) const
```

getEntities(): Get the EntityManager's entities.

Parameters

Returns

 $std::map{<}std::string,\ Entity\ *{>}:\ Entities.$

4.6.2.3 getEntity()

getEntity(): Get an entity from the entity manager by its name.

Template Parameters

Parameters

nameEntity Name of the entity.

Returns

T&: Reference of the entity.

4.6.2.4 getEntityMap()

```
\verb|std::map| < \verb|std::string|, Entity| * > EntityManager::getEntityMap ( ) const| \\
```

getEntityMap(): Get the EntityManager's entity map.

Parameters

void

Returns

Entity::EntityMap: Entity map.

4.6.2.5 init()

bool EntityManager::init () [override], [virtual]

initEntityManager(): Initialize the EntityManager.

Parameters

void

Returns

bool: true if the EntityManager is initialized, false otherwise.

Reimplemented from Entity.

Reimplemented in World.

The documentation for this class was generated from the following files:

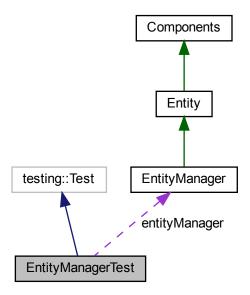

- src/Entity/include/entityManager.h
- src/Entity/entityManager.cpp

4.9 EventEngine Class Reference

EventEngine class: EventEngine is a class that represents the event engine of the game.

#include <eventEngine.h>

Inheritance diagram for EventEngine:

Public Member Functions

• EventEngine ()=default

Default EventEngine constructor.

- virtual ∼EventEngine ()=default
 - EventEngine destructor.
- sf::Event & getEvent ()

getEvent(): Get the SFML Event.

- $\bullet \ \ void \ add Key Pressed \ (sf:: Key board:: Key \ key board, \ const \ std:: function < void () > \& function) \\$
 - addKeyPressed(): Add a key pressed to the map.
- void addMouseButtonPressed (sf::Mouse::Button mouse, const std::function < void() > &function)
 addMouseButtonPressed(): Add a mouse button pressed to the map.
- void addMouseMoved (const std::string &nameEntity, const std::function< void()> &function)
 addMouseMoved(): Add a mouse moved to the map.
- std::map< sf::Keyboard::Key, std::function< void()>> & getKeyPressedMap ()
 getKeyPressedMap(): Get the map of the key pressed.
- $\bullet \ \, \text{std::map}{<} \ \, \text{sf::Mouse::Button, std::function}{<} \ \, \text{void()}{>} \ \, \text{>} \ \, \text{getMouseButtonPressedMap ()}$

getMouseButtonPressedMap(): Get the map of the mouse button pressed.

- $\bullet \; \; \mathsf{std} :: \mathsf{map} < \mathsf{std} :: \mathsf{string}, \; \mathsf{std} :: \mathsf{function} < \mathsf{void}() > > \& \; \mathsf{getMouseMovedMap} \; () \\$
- getMouseMovedPressedMap(): Get the map of the key pressed.
 std::map< sf::Keyboard::Key, bool > & getKeyStatesMap ()

getKeyStatesMap(): Get the map of the key states.

void setKeyStatesMap (sf::Keyboard::Key key)

setKeyStatesMap(sf::Keyboard::Key): Initialize the map of the key states for the parameter value to false

4.9.1 Detailed Description

EventEngine class: EventEngine is a class that represents the event engine of the game.

The EventEngine class manages the events of the game.

4.9.2 Constructor & Destructor Documentation

4.9.2.1 EventEngine() EventEngine::EventEngine () [default] Default EventEngine constructor. **Parameters** void Returns void 4.9.2.2 ∼EventEngine() virtual EventEngine::~EventEngine () [virtual], [default] EventEngine destructor. **Parameters** void Returns void

4.9.3 Member Function Documentation

4.9.3.1 addKeyPressed()

```
void EventEngine::addKeyPressed (
          sf::Keyboard::Key keyboard,
          const std::function void()> & function )
```

addKeyPressed(): Add a key pressed to the map.

Parameters

| keyboard | SFML Keyboard::Key of the key pressed. | |
|----------|--|--|
| function | Function to execute when the key is pressed. | |

Returns

void

4.9.3.2 addMouseButtonPressed()

```
void EventEngine::addMouseButtonPressed ( sf::Mouse::Button\ \textit{mouse,} const std::function<br/>< void()> & function )
```

addMouseButtonPressed(): Add a mouse button pressed to the map.

Parameters

| mouse | SFML Mouse::Button of the mouse button pressed. |
|----------|---|
| function | Function to execute when the mouse button is pressed. |

Returns

void

4.9.3.3 addMouseMoved()

addMouseMoved(): Add a mouse moved to the map.

Parameters

| nameEntity | : Name of the Entity you want. | |
|------------|---|--|
| function | Function to execute when the mouse moved on entity. | |

Returns

void

4.9.3.4 getEvent()

```
sf::Event & EventEngine::getEvent ( )

getEvent(): Get the SFML Event.

Parameters

void
```

Returns

sf::Event: The SFML Event.

4.9.3.5 getKeyPressedMap()

```
 std::map < sf::Keyboard::Key, std::function < void() > > \& EventEngine::getKeyPressedMap() ) \\ getKeyPressedMap(): Get the map of the key pressed.
```

Parameters

void

Returns

std::map<sf::Keyboard::Key, std::function<void()>>: The map of the key pressed.

4.9.3.6 getKeyStatesMap()

```
\label{eq:std:map} $$std::map< sf::Keyboard::Key, bool > \& EventEngine::getKeyStatesMap () $$ getKeyStatesMap(): Get the map of the key states.
```

Parameters

void

Returns

std::map<sf::Keyboard::Key, bool>&: The map of the key states.

4.9.3.7 getMouseButtonPressedMap()

 $\verb|std::map| < sf::Mouse::Button, std::function| < void() > > & EventEngine::getMouseButtonPressedMap () \\$

getMouseButtonPressedMap(): Get the map of the mouse button pressed.

Parameters

Returns

std::map<sf::Mouse::Button, std::function<void()>>: The map of the mouse button pressed.

4.9.3.8 getMouseMovedMap()

getMouseMovedPressedMap(): Get the map of the key pressed.

Parameters

void

Returns

std::map<std::string, std::function<void()>>: The map of the mouse moved.

4.9.3.9 setKeyStatesMap()

setKeyStatesMap(sf::Keyboard::Key): Initialize the map of the key states for the parameter value to false

Parameters

key The touch of the keyboard with using SFML.

Returns

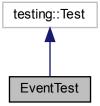

void

The documentation for this class was generated from the following files:

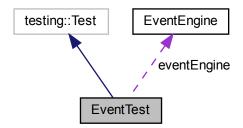

- src/Event/include/eventEngine.h
- src/Event/eventEngine.cpp

Inheritance diagram for GameEngine:

Collaboration diagram for GameEngine:

Public Member Functions

- GameEngine ()=default
 - < Time of the game. Using with the Clock.
- GameEngine (sf::VideoMode mode, const sf::String &title, sf::Uint32 style=sf::Style::Default, const sf::← ContextSettings &settings=sf::ContextSettings())

GameEngine constructor with parameters.

 $\bullet \ \, \sim\!\! \text{GameEngine () override=default}$

GameEngine destructor.

void run (std::map< std::string, std::unique_ptr< World >> mapWorld, const std::map< std::string, std
 ::vector< std::pair< std::string, std::string >>> &pathRessources, const std::string &firstScene)

run(): Run the game engine (with parameters).

• void renderGameEngine ()

renderGameEngine(): Render the game engine.

· void eventGameEngine ()

eventGameEngine(): Manage the events of the game engine.

• void updateGameEngine ()

updateGameEngine(): Update the game engine.

• bool isWindowOpen ()

isWindowOpen(): Check if the window is open.

void initialize (std::map< std::string, std::unique_ptr< World >> mapWorld, const std::map< std::string, std::vector< std::pair< std::string, std::string >>> &pathRessources, const std::string &firstScene)

initialize(): Initialize the game engine.

· void initializeSpriteFunction () const

```
initializeSpriteFunction(): Initialize the sprites function.
· void initializeSoundFunction () const
      initializeSoundFunction(): Initialize the sound function.

    void initializeMusicFunction () const

      initializeMusicFunction(): Initialize the music function.

    void initializeTextFunction () const

      initializeFontFunction(): Initialize the font function.

    void initializeAllFiles (const std::map< std::string, std::vector< std::pair< std::string, std::string >>>

  &pathRessources)
      initializeAllFiles(): Initialize all the ressources files the engine need.

    void initializeTexture (const std::vector< std::pair< std::string, std::string >> &files)

      initialize Texture(): Initialize the textures with their path.

    void initializeSound (const std::vector< std::pair< std::string, std::string >> &files)

      initializeSound(): Initialize the sound with their path.

    void initializeMusic (const std::vector< std::pair< std::string, std::string >> &files)

      initializeMusic(): Initialize the music with their path.

    void initializeFont (const std::vector< std::pair< std::string, std::string >> &files)

      initializeFont(): Initialize the font with their path.

    void initializeWorldMap (std::map < std::string, std::unique ptr < World >> mapWorld)

      initializeWorldMap(): Initialize the world map.

    sf::RenderWindow & getWindow ()

      getWindow(): Get the window.

    EventEngine & getEventEngine ()

      getEventEngine(): Get the event engine.

    void setCurrentWorld (World *world)

      setCurrentWorld(): Set GameEngine's current world.

    World * getCurrentWorld () const

      getCurrentWorld(): Get GameEngine's current world.

    World & addWorld (const std::string &nameWorld, std::unique ptr< World > world)

      addWorld(): Add a world to the world map.

    World & getWorld (const std::string &nameWorld)

      getWorld(): Get a world from the world map with its name.

    std::map< std::string, std::shared_ptr< sf::Texture >> getMapTexture () const

      getMapTexture(): Get GameEngine's map of the textures.

    std::map< std::string, World * > getWorldMap () const

      getWorldMap(): Get GameEngine's map of the worlds.

    std::map< std::string, std::shared ptr< sf::Music >> getMapMusic () const

      getMapMusic(): Get GameEngine's map of the music.
• std::map< std::string, std::shared ptr< sf::SoundBuffer >> getMapSound () const
      getMapSound(): Get GameEngine's map of the sound.

    std::map< std::string, std::shared_ptr< sf::Font >> getMapFont () const

      getMapFont(): Get GameEngine's map of the font.
• sf::Clock getClock () const
      getClock(): Get GameEngine's clock.

    sf::Time getDeltaTime () const

      getDeltaTime(): Get GameEngine's deltaTime.

    void setDeltaTime (sf::Time newTimeDelta)

      setDeltaTime(): Set GameEngine's deltaTime.
```

Static Public Member Functions

• static std::vector< std::string > getFilesRessources (const std::string &pathDirectory) getFilesRessources(): Get all the ressources type files in the given directory.

Additional Inherited Members

4.11.1 Detailed Description

GameEngine class: GameEngine is a class that represents the game engine.

The GameEngine class manages the game engine.

4.11.2 Constructor & Destructor Documentation

4.11.2.1 GameEngine() [1/2]

```
GameEngine::GameEngine ( ) [default]
```

< Time of the game. Using with the Clock.

Default GameEngine constructor.

Parameters

void

Returns

void

4.11.2.2 GameEngine() [2/2]

GameEngine constructor with parameters.

Parameters

| mode | Video mode. |
|----------|--|
| type | Type of the graphics ("2D" or "3D"). |
| title | Title of the window. |
| style | Style of the window (sf::Style::Default by default). |
| settings | Settings of the window. |

Returns

void

4.11.2.3 ∼GameEngine()

```
GameEngine::~GameEngine ( ) [override], [default]
```

GameEngine destructor.

Parameters

Returns

void

4.11.3 Member Function Documentation

4.11.3.1 addWorld()

addWorld(): Add a world to the world map.

Parameters

| nameWorld | Name of the world. | | |
|-----------|--------------------|--|--|
| world | World to add. | | |

Returns

World&: The world.

4.11.3.2 eventGameEngine()

```
void GameEngine::eventGameEngine ( )
```

eventGameEngine(): Manage the events of the game engine.

Parameters

void

Returns

void

4.11.3.3 getClock()

```
sf::Clock GameEngine::getClock ( ) const
```

getClock(): Get GameEngine's clock.

Parameters

void

Returns

sf::Clock: GameEngine's clock.

4.11.3.4 getCurrentWorld()

```
World * GameEngine::getCurrentWorld ( ) const
```

getCurrentWorld(): Get GameEngine's current world.

Parameters

void

Returns

World*: GameEngine's current world.

4.11.3.5 getDeltaTime()

```
sf::Time GameEngine::getDeltaTime ( ) const
```

getDeltaTime(): Get GameEngine's deltaTime.

Parameters

Returns

sf::Time: GameEngine's deltaTimes.

4.11.3.6 getEventEngine()

```
EventEngine & GameEngine::getEventEngine ( )
```

getEventEngine(): Get the event engine.

Parameters

void

Returns

EventEngine&: GameEngine's EventEngine.

4.11.3.7 getFilesRessources()

getFilesRessources(): Get all the ressources type files in the given directory.

Parameters

pathDirectory Path of the directory.

Returns

std::vector<std::string>: Vector of the ressources type files' names.

4.11.3.8 getMapFont()

std::map< std::string, std::shared_ptr< sf::Font > > GameEngine::getMapFont () const
getMapFont(): Get GameEngine's map of the font.

Parameters

void

Returns

std::map<std::string, std::shared_ptr<sf::Font>>: GameEngine's map of the musics.

4.11.3.9 getMapMusic()

std::map< std::string, std::shared_ptr< sf::Music > > GameEngine::getMapMusic () const
getMapMusic(): Get GameEngine's map of the music.

Parameters

void

Returns

std::map<std::string, std::shared ptr<sf::Music>>: GameEngine's map of the musics.

4.11.3.10 getMapSound()

std::map< std::string, std::shared_ptr< sf::SoundBuffer > > GameEngine::getMapSound () const
getMapSound(): Get GameEngine's map of the sound.

Parameters

void

Returns

std::map<std::string, std::shared_ptr<sf::SoundBuffer>>: GameEngine's map of the musics.

4.11.3.11 getMapTexture()

```
std::map< std::string, std::shared_ptr< sf::Texture > > GameEngine::getMapTexture ( ) const
getMapTexture(): Get GameEngine's map of the textures.
```

Parameters

Returns

std::map<std::string, std::shared_ptr<sf::Texture>>: GameEngine's map of the textures.

4.11.3.12 getWindow()

```
sf::RenderWindow & GameEngine::getWindow ( )
getWindow(): Get the window.
```

Parameters

Returns

sf::RenderWindow&: GameEngine's window.

4.11.3.13 getWorld()

getWorld(): Get a world from the world map with its name.

Parameters

Returns

World&: GameEngine's world.

4.11.3.14 getWorldMap()

```
\verb|std::map| < \verb|std::string|, | \verb|World| * > \verb|GameEngine::getWorldMap| ( ) | const| \\
```

getWorldMap(): Get GameEngine's map of the worlds.

Parameters

Returns

std::map<std::string, World*>: GameEngine's map of the worlds.

4.11.3.15 initialize()

initialize(): Initialize the game engine.

Parameters

| mapWorld | Map of World classes' unique pointers. | | |
|----------------|---|--|--|
| pathRessources | Map of the path of the ressources (assets). | | |
| firstScene | Name of the first scene. | | |

Returns

void

4.11.3.16 initializeAllFiles()

initializeAllFiles(): Initialize all the ressources files the engine need.

Parameters

| pathRessources | Map of the path of the ressources (assets). | |
|-----------------|---|---|
| patinicosources | wap of the path of the ressources (assets). | П |

Returns

void

4.11.3.17 initializeFont()

initializeFont(): Initialize the font with their path.

Parameters

path | Path of the font file.

Returns

void

4.11.3.18 initializeMusic()

```
void GameEngine::initializeMusic ( const\ std::vector<\ std::pair<\ std::string,\ std::string\ >>\ \&\ files\ )
```

initializeMusic(): Initialize the music with their path.

Parameters

path Path of the music file.

Returns

void

4.11.3.19 initializeMusicFunction()

```
\label{thm:cond} \mbox{{\tt Void GameEngine::}} \mbox{{\tt initializeMusicFunction ()}} \mbox{{\tt const}}
```

initializeMusicFunction(): Initialize the music function.

| Parameters Void |
|---|
| Returns void |
| 4.11.3.20 initializeSound() |
| <pre>void GameEngine::initializeSound (</pre> |
| initializeSound(): Initialize the sound with their path. |
| Parameters path Path of the sound file. |
| Returns void |
| Void |
| |
| 4.11.3.21 initializeSoundFunction() |
| <pre>void GameEngine::initializeSoundFunction () const</pre> |
| initializeSoundFunction(): Initialize the sound function. |
| Parameters void |
| Returns |
| void |
| |
| |

4.11.3.22 initializeSpriteFunction()

void GameEngine::initializeSpriteFunction () const

initializeSpriteFunction(): Initialize the sprites function.

| Da | | | | | |
|----|----|---|----|---|----|
| ra | ra | m | eı | œ | rs |

void

Returns

void

4.11.3.23 initializeTextFunction()

```
void GameEngine::initializeTextFunction ( ) const
```

initializeFontFunction(): Initialize the font function.

Parameters

void

Returns

void

4.11.3.24 initializeTexture()

initializeTexture(): Initialize the textures with their path.

Parameters

path Path of the texture.

Returns

void

4.11.3.25 initializeWorldMap()

```
void GameEngine::initializeWorldMap ( std::map < \ std::string, \ std::unique\_ptr < \ World >> \ mapWorld )
```

initializeWorldMap(): Initialize the world map.

Parameters

mapWorld Map of World classes' unique pointers.

Returns

void

4.11.3.26 isWindowOpen()

```
bool GameEngine::isWindowOpen ( )
```

isWindowOpen(): Check if the window is open.

Parameters

void

Returns

bool: True if the window is open, false otherwise.

4.11.3.27 renderGameEngine()

```
void GameEngine::renderGameEngine ( )
```

renderGameEngine(): Render the game engine.

Parameters

void

Returns

void

4.11.3.28 run()

run(): Run the game engine (with parameters).

Parameters

| mapWorld | Map of World classes' unique pointers. |
|----------------|---|
| pathRessources | Map of the path of the ressources (assets). |
| firstScene | Name of the first scene. |

Returns

void

4.11.3.29 setCurrentWorld()

setCurrentWorld(): Set GameEngine's current world.

Parameters

| world | World to set. |
|-------|---------------|
| | |

Returns

void

4.11.3.30 setDeltaTime()

setDeltaTime(): Set GameEngine's deltaTime.

Parameters

| newTimeDelta | New deltaTime for GameEngine's deltaTime. |
|--------------|---|

Returns

void

4.11.3.31 updateGameEngine()

void GameEngine::updateGameEngine ()

updateGameEngine(): Update the game engine.

Parameters

void

Returns

void

The documentation for this class was generated from the following files:

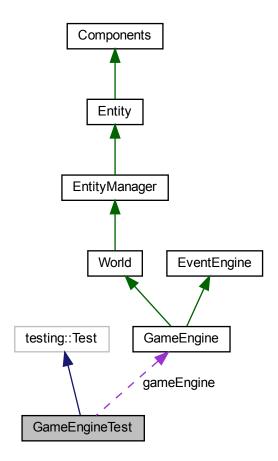

- src/GameEngine/include/gameEngine.h
- src/GameEngine/gameEngine.cpp

4.12 GameEngineTest Class Reference

Inheritance diagram for GameEngineTest:

Collaboration diagram for GameEngineTest:

Protected Member Functions

• void TearDown () override

Protected Attributes

• GameEngine * gameEngine

The documentation for this class was generated from the following file:

4.13 ITransform Class Reference

ITransform class: ITransform is a class that represents an interface of the Component Transform.

#include <ITransform.h>

Inheritance diagram for ITransform:

Public Member Functions

- virtual ~ITransform ()=default

 Default Virtual ITransform destructor.
- virtual Transform * getTransform ()=0

getTransform(): Get the reference of the component Transform of the same Entity

4.13.1 Detailed Description

ITransform class: ITransform is a class that represents an interface of the Component Transform.

The ITransform interface give to components which need to have a reference to Transform

4.13.2 Constructor & Destructor Documentation

4.13.2.1 \sim ITransform()

virtual ITransform::~ITransform () [virtual], [default]

Default Virtual ITransform destructor.

Parameters

void

Returns

void

4.13.3 Member Function Documentation

4.13.3.1 getTransform()

```
virtual Transform* ITransform::getTransform ( ) [pure virtual]
```

getTransform(): Get the reference of the component Transform of the same Entity

Virtual function which get the reference of the Transform component from the same Entity when a component need to use Transform. If Transform don't exist getTransform() return nullptr.

Parameters

Returns

Transform*: The reference of Transform or nullptr.

Implemented in Text, and Sprite.

The documentation for this class was generated from the following file:

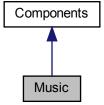

• src/Components/all_components/include/ITransform.h

4.14 Music Class Reference

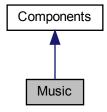

Music class: Music is a class that represents the music in the world.

```
#include <Music.h>
```

Inheritance diagram for Music:

Collaboration diagram for Music:

Public Member Functions

```
• Music ()=default
```

< Bit of the Music

∼Music () override=default

Default override Music destructor.

• int getBit () override

getBit(): Get the bit of the Music.

· void update (sf::Time timeDelta) override

update(sf::Time): Update the component Music

· bool init () override

init(): Initialize the component.

void setMusic (std::map< std::string, std::shared_ptr< sf::Music >> mapMusic, const std::string &name←
 Music)

setMusic(std::map<std::string, std::shared_ptr<sf::Music>>, const std::string&): Initialize the sf::Music of the class.

void setDeferredMusic (std::function< void()> setter)

setDeferredMusic(std::function< void()>): Set the deferred function for Music.

void applyDeferredMusic ()

applyDeferredMusic(): Apply the deferred function for Music

std::shared_ptr< sf::Music > getMusic () const

getMusic(): Get the music.

void play ()

play(): Play the music.

• void pause ()

pause(): Pause the music.

• void stop ()

stop(): Stop the music.

void setLoop (bool loop)

setLoop(bool): Set the loop of the music.

• bool getLoop () const

getLoop(): Get if the loop is set to True or False.

• void setVolume (float volume)

 ${\color{red} \textit{setVolume(float):}} \ \textit{Set the volume of the music.}$

• float getVolume () const

getVolume(): Get the volume of the music.

• sf::SoundSource::Status getStatus () const

getStatus(): Get the status of the music. Playing, pause or stop.

4.14.1 Detailed Description

Music class: Music is a class that represents the music in the world.

The music class manages the music from an Entity using SFML.

4.14.2 Constructor & Destructor Documentation

4.14.2.1 Music() Music::Music () [default] < Bit of the Music Default Music constructor. **Parameters** void Returns void 4.14.2.2 ∼Music() Music::~Music () [override], [default] Default override Music destructor. **Parameters** void Returns void

4.14.3 Member Function Documentation

4.14.3.1 applyDeferredMusic()

void Music::applyDeferredMusic () applyDeferredMusic(): Apply the deferred function for Music **Parameters** void Returns void 4.14.3.2 getBit() int Music::getBit () [override], [virtual] getBit(): Get the bit of the Music. **Parameters** void Returns int: The bit of the Music. Implements Components. 4.14.3.3 getLoop() bool Music::getLoop () const getLoop(): Get if the loop is set to True or False.

Returns

Parameters void

bool: True or False. If no music set, return false.

4.14.3.4 getMusic()

std::shared_ptr< sf::Music > Music::getMusic () const
getMusic(): Get the music.

Parameters

void

Returns

 $std::shared_ptr{<}sf::Music{>}: The \ shared \ ptr \ of \ the \ music.$

4.14.3.5 getStatus()

sf::SoundSource::Status Music::getStatus () const

getStatus(): Get the status of the music. Playing, pause or stop.

Parameters

void

Returns

sf::SoundSource::Status: Enumerator of sf::SoundSource::Status which is (Stopped, Paused, Playing). If no music set, return Stopped.

4.14.3.6 getVolume()

float Music::getVolume () const

getVolume(): Get the volume of the music.

Parameters

void

Returns

float: Float number that represents the volume between 0 and 100 of the music. If no music set, return -100.

4.14.3.7 init()

```
bool Music::init ( ) [override], [virtual]
init(): Initialize the component.
Parameters
```

Returns

void

bool: true if the component is initialized, false otherwise

Implements Components.

4.14.3.8 pause()

void Music::pause ()
pause(): Pause the music.

Parameters

void

Returns

void

4.14.3.9 play()

void Music::play ()
play(): Play the music.

Parameters

void

Returns

void

4.14.3.10 setDeferredMusic()

```
void Music::setDeferredMusic ( {\tt std::function} < {\tt void()} > {\tt setter} \ )
```

setDeferredMusic(std::function<void()>): Set the deferred function for Music.

Parameters

setter Function that will use Music.

Returns

void

4.14.3.11 setLoop()

```
void Music::setLoop (
          bool loop )
```

setLoop(bool): Set the loop of the music.

Parameters

```
loop True or False.
```

Returns

void

4.14.3.12 setMusic()

```
void Music::setMusic (
          std::map< std::string, std::shared_ptr< sf::Music >> mapMusic,
          const std::string & nameMusic )
```

 $setMusic(std::map < std::string, std::shared_ptr < sf::Music >>, const std::string\&): Initialize the sf::Music of the class.$

Parameters

| mapMusic | Map of all the music loaded. | |
|----------|------------------------------|---------------------------|
| | nameMusic | Name of the music loaded. |

Returns

void

4.14.3.13 setVolume()

setVolume(float): Set the volume of the music.

Parameters

volume Float number that represents the volume between 0 and 100 of the music.

Returns

void

4.14.3.14 stop()

```
void Music::stop ( )
```

stop(): Stop the music.

Parameters

void

Returns

void

4.14.3.15 update()

update(sf::Time): Update the component Music

Parameters

| timeDelta sf::Time of the game. |
|---------------------------------|
|---------------------------------|

Returns

void

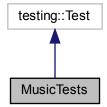

Implements Components.

The documentation for this class was generated from the following files:

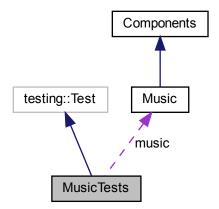

- src/Components/all_components/include/Music.h
- src/Components/all_components/Music.cpp

4.16 Rect < T > Class Template Reference

Rect class: Rect is a class that represents a rectangle.

```
#include <Rect.h>
```

Public Member Functions

• Rect (T left, T top, T width, T height)

< Rect is the variable you can use for change the data in RectStruct.

∼Rect ()=default

Rect destructor.

RectStruct getRect () const

getRect(): Get the using RectStruct.

• T getLeft () const

getLeft(): Get the using RectStruct left.

• T getTop () const

getTop(): Get the using RectStruct top.

T getWidth () const

getWidth(): Get the using RectStruct width.

• T getHeight () const

getHeight(): Get the using RectStruct height.

• bool contains (T x, T y) const

contains(): Check if a point is in the rectangle.

4.16.1 Detailed Description

```
template < typename T> class Rect < T>
```

Rect class: Rect is a class that represents a rectangle.

This create a rectangle and using for what you want.

4.16.2 Constructor & Destructor Documentation

4.16.2.1 Rect()

< Rect is the variable you can use for change the data in RectStruct.

Rect constructor with parameters.

Template Parameters

Parameters

| left | Position x. |
|--------|---------------------------|
| top | Position y. |
| width | Width of your rectangle. |
| height | Height of your rectangle. |

Returns

void

4.16.2.2 \sim Rect()

```
template<typename T > Rect< T >::\simRect ( ) [default]
```

Rect destructor.

Template Parameters

Parameters

Returns

void

4.16.3 Member Function Documentation

4.16.3.1 contains()

contains(): Check if a point is in the rectangle.

Template Parameters

| T Type of the rect. | |
|---------------------|--|
|---------------------|--|

Parameters

| X | : Position x of the point. |
|---|----------------------------|
| У | : Position y of the point. |

Returns

T: T is the type you want (float, int,...).

4.16.3.2 getHeight()

```
template<typename T >
template int Rect< T >::getHeight ( ) const
```

getHeight(): Get the using RectStruct height.

Template Parameters

Parameters

void

Returns

 $\mathsf{T}:\mathsf{T}$ is the type you want (float, int,...).

4.16.3.3 getLeft()

```
template<typename T > template int Rect< T >::getLeft ( ) const
```

getLeft(): Get the using RectStruct left.

Template Parameters

Parameters

void

Returns

T: T is the type you want (float, int,...).

4.16.3.4 getRect()

```
template<typename T >
RectStruct Rect< T >::getRect ( ) const [inline]
```

getRect(): Get the using RectStruct.

Parameters

void

Returns

Rect

4.16.3.5 getTop()

```
template<typename T > template int Rect< T >::getTop ( ) const
```

getTop(): Get the using RectStruct top.

Template Parameters

| Τ | Type of the rect. |
|---|-------------------|
|---|-------------------|

Parameters

void

Returns

T: T is the type you want (float, int,...).

4.16.3.6 getWidth()

```
template<typename T > template int Rect< T >::getWidth ( ) const
```

getWidth(): Get the using RectStruct width.

Template Parameters

Parameters

void

Returns

T: T is the type you want (float, int,...).

4.18 Sound Class Reference

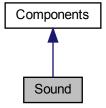

Sound class: Sound is a class that represents the sound properties of a Component.

#include <Sound.h>

Inheritance diagram for Sound:

Collaboration diagram for Sound:

Public Member Functions

• Sound ()=default

< Bit of the Sound.

∼Sound () override=default

Default override Sound destructor.

• int getBit () override

getBit(): Get the bit of the Sound.

• void update (sf::Time timeDelta) override

update(sf::Time): Update the component Sound

• bool init () override

init(): Initialize the component.

• void setSound (const sf::Sound &sound)

setSound(const sf::Sound&): Set the sound with an existing one. Automatically set the component sound buffer.

 void setSound (std::map< std::string, std::shared_ptr< sf::SoundBuffer >> mapSound, const std::string &nameSound)

setSound(std::map<std::string, std::shared_ptr<sf::SoundBuffer>>, const std::string&): Initialize the sf::Sound of the class.

void setDeferredSound (std::function < void() > setter)

setDeferredSound(std::function<void()>): Set the deferred function for Sound.

• void applyDeferredSound ()

applyDeferredSound(): Apply the deferred function for Sound

• const sf::Sound & getSound () const

getSound(): Get the sound.

• void play ()

play(): Play the sound.

· void pause ()

pause(): Pause the sound.

• void stop ()

stop(): Stop the sound.

void setLoop (bool loop)

setLoop(bool): Set the loop of the sound.

• bool getLoop () const

getLoop(): Get if the loop is set to True or False.

void setVolume (float volume)

setVolume(float): Set the volume of the sound.

• float getVolume () const

getVolume(): Get the volume of the sound.

• bool isPlaying () const

isPlaying(): Check if the sound is currently playing.

4.18.1 Detailed Description

Sound class: Sound is a class that represents the sound properties of a Component.

The Sound class manages the sound representation of a Component using SFML.

4.18.2 Constructor & Destructor Documentation

4.18.2.1 Sound()

Sound::Sound () [default]

< Bit of the Sound.

Default Sound constructor.

Parameters

void

Returns

void

4.18.2.2 ∼Sound()

```
Sound::~Sound ( ) [override], [default]
```

Default override Sound destructor.

Parameters

Returns

void

4.18.3 Member Function Documentation

4.18.3.1 applyDeferredSound()

```
void Sound::applyDeferredSound ( )
```

applyDeferredSound(): Apply the deferred function for Sound

Parameters

void

Returns

void

4.18.3.2 getBit()

```
int Sound::getBit ( ) [override], [virtual]
```

getBit(): Get the bit of the Sound.

| Parameters void |
|--|
| Returns |
| int: The bit of the Sound. |
| |
| Implements Components. |
| |
| |
| 4.18.3.3 getLoop() |
| bool Sound::getLoop () const |
| getLoop(): Get if the loop is set to True or False. |
| Parameters |
| void |
| |
| |
| Returns |
| bool: True or False. |
| |
| |
| 4.18.3.4 getSound() |
| |
| <pre>const sf::Sound & Sound::getSound () const</pre> |
| getSound(): Get the sound. |
| Parameters |
| void |
| |
| Returns |
| const sf::Sound&: The shared ptr of the sound. |
| |
| 4.18.3.5 getVolume() |

Generated by Doxygen

float Sound::getVolume () const

getVolume(): Get the volume of the sound.

Parameters

Returns

float: Float number that represents the volume between 0 and 100 of the sound.

4.18.3.6 init()

```
bool Sound::init ( ) [override], [virtual]
```

init(): Initialize the component.

Parameters

Returns

bool: true if the component is initialized, false otherwise

Implements Components.

4.18.3.7 isPlaying()

```
bool Sound::isPlaying ( ) const
```

isPlaying(): Check if the sound is currently playing.

Parameters

Returns

bool: True if the sound is playing, false otherwise.

4.18.3.8 pause()

```
void Sound::pause ( )
```

pause(): Pause the sound.

Parameters void Returns void 4.18.3.9 play() void Sound::play () play(): Play the sound. **Parameters** void Returns void 4.18.3.10 setDeferredSound() void Sound::setDeferredSound (std::function< void() > setter) $setDeferredSound(std::function < void()>) : Set \ the \ deferred \ function \ for \ Sound.$ **Parameters** setter Function that will use Sound. Returns void 4.18.3.11 setLoop()

```
void Sound::setLoop (
             bool loop )
```

setLoop(bool): Set the loop of the sound.

Parameters

| loop Tru | e or False. |
|----------|-------------|
|----------|-------------|

Returns

void

4.18.3.12 setSound() [1/2]

setSound(const sf::Sound&): Set the sound with an existing one. Automatically set the component sound buffer.

Parameters

sound SFML Sound for sound.

Returns

void

4.18.3.13 setSound() [2/2]

```
void Sound::setSound (
          std::map< std::string, std::shared_ptr< sf::SoundBuffer >> mapSound,
          const std::string & nameSound )
```

 $setSound(std::map{<}std::string, std::shared_ptr{<}sf::SoundBuffer{>>}, const std::string\&): Initialize the sf::Sound of the class.$

Parameters

| mapSound | Map of all the sound loaded. |
|-----------|------------------------------|
| nameSound | Name of the sound loaded. |

Returns

void

4.18.3.14 setVolume()

setVolume(float): Set the volume of the sound.

Parameters

volume

Float number that represents the volume between 0 and 100 of the sound.

Returns

void

4.18.3.15 stop()

```
void Sound::stop ( )
```

stop(): Stop the sound.

Parameters

void

Returns

void

4.18.3.16 update()

update(sf::Time): Update the component Sound

Parameters

timeDelta sf::Time of the game.

Returns

void

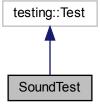

Implements Components.

The documentation for this class was generated from the following files:

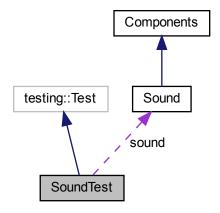

- src/Components/all_components/include/Sound.h
- src/Components/all_components/Sound.cpp

4.19 SoundTest Class Reference

4.20 Sprite Class Reference

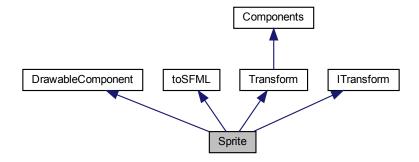

Sprite class: Sprite is a class that represents the rendering properties of a Component.

```
#include <Sprite.h>
```

Inheritance diagram for Sprite:

Collaboration diagram for Sprite:

Public Member Functions

```
• Sprite ()
```

< Doing the animation.

∼Sprite () override=default

Default override Sprite destructor.

Transform * getTransform () override

getTransform(): Get the reference to the component Transform.

· bool init () override

init(): Initialize the component.

• int getBit () override

getBit(): Get the bit of the Music.

· void draw (sf::RenderWindow &window) const override

draw(): Draw the Sprite.

• void update (sf::Time deltaTime) override

update(sf::Time): Update the component Music

• sf::Sprite getSprite () const

getSprite(): Get the SFML Sprite for rendering.

void setSprite (const sf::Sprite &sprite)

setSprite(sf::Sprite&): Set the SFML Sprite with an existing one for rendering.

void setSprite (std::map< std::string, std::shared_ptr< sf::Texture >> mapTexture, const std::string &name
 Texture, bool animate=false, const std::vector< Rect< int >> &newFrames=std::vector< Rect< int >>(), int durationOfFrame=100)

Sets the sprite of the component.

void setDeferredSprite (std::function < void() > setter)

 $setDeferredSprite(std::function < void() >) : Set \ the \ deferred \ sprite.$

void applyDeferredSprite ()

applyDeferredSprite(): Apply the deferred sprite.

void setTransform (Transform &newTransform)

setTransform(Transform&): Set the reference of the Transform component.

4.20.1 Detailed Description

Sprite class: Sprite is a class that represents the rendering properties of a Component.

The Sprite class manages the graphical representation of a Component using SFML.

4.20.2 Constructor & Destructor Documentation

4.20.2.1 Sprite()

```
Sprite::Sprite ( ) [inline]
```

< Doing the animation.

Default Sprite constructor.

| Parameters Void |
|---|
| Returns void |
| 4.20.2.2 ∼Sprite() |
| Sprite::~Sprite () [override], [default] |
| Default override Sprite destructor. |
| Parameters void |
| Returns |
| void |
| 4.20.3 Member Function Documentation |
| 4.20.3.1 applyDeferredSprite() |
| <pre>void Sprite::applyDeferredSprite ()</pre> |
| applyDeferredSprite(): Apply the deferred sprite. |
| Parameters void |
| Returns void |
| |
| 4.20.3.2 draw() |

draw(): Draw the Sprite.

Parameters

window | SFML RenderWindow where the Sprite will be drawn.

Returns

void

Implements DrawableComponent.

4.20.3.3 getBit()

```
int Sprite::getBit ( ) [override], [virtual]
```

getBit(): Get the bit of the Music.

Parameters

void

Returns

int: The bit of the Music.

Implements Components.

4.20.3.4 getSprite()

```
sf::Sprite Sprite::getSprite ( ) const
```

getSprite(): Get the SFML Sprite for rendering.

Parameters

void

Returns

sf::Sprite: SFML Sprite for rendering

4.20.3.5 getTransform()

```
Transform * Sprite::getTransform ( ) [override], [virtual]
getTransform(): Get the reference to the component Transform.

Parameters

void
```

Returns

Transform*: Reference of Transform

Implements ITransform.

4.20.3.6 init()

```
bool Sprite::init ( ) [override], [virtual]
```

init(): Initialize the component.

Parameters

void

Returns

bool: true if the component is initialized, false otherwise

Implements Components.

4.20.3.7 setDeferredSprite()

setDeferredSprite(std::function<void()>): Set the deferred sprite.

Parameters

setter Function that will set the sprite.

Returns

void

4.20.3.8 setSprite() [1/2]

setSprite(sf::Sprite&): Set the SFML Sprite with an existing one for rendering.

Parameters

```
sprite | SFML Sprite for rendering
```

Returns

void

4.20.3.9 setSprite() [2/2]

```
void Sprite::setSprite (
    std::map< std::string, std::shared_ptr< sf::Texture >> mapTexture,
    const std::string & nameTexture,
    bool animate = false,
    const std::vector< Rect< int >> & newFrames = std::vector<Rect<int>>>(),
    int durationOfFrame = 100 )
```

Sets the sprite of the component.

This function sets the sprite of the component using the provided texture map and texture name. Optionally, it can enable animation by providing a vector of frames and the duration of each frame.

Parameters

| mapTexture | A map of texture names and their corresponding shared pointers to sf::Texture objects. |
|-----------------|--|
| nameTexture | The name of the texture to set as the sprite. |
| animate | Flag indicating whether to enable animation or not. Default is false. |
| newFrames | A vector of frames to use for animation. Default is an empty vector. |
| durationOfFrame | The duration of each frame in milliseconds. Default is 100 milliseconds. |

Returns

void

4.20.3.10 setTransform()

setTransform(Transform&): Set the reference of the Transform component.

Parameters

Returns

void

4.20.3.11 update()

update(sf::Time): Update the component Music

Parameters

timeDelta sf::Time of the game.

Returns

void

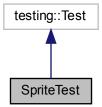

Implements Components.

4.27 Text Class Reference

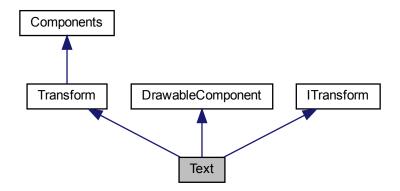

Text class: Text is a class that represents the text in the world.

```
#include <Text.h>
```

Inheritance diagram for Text:

Collaboration diagram for Text:

Public Member Functions

- Text ()
 - < Bit of the Text.
- ∼Text () override=default

Default override Text destructor.

4.27 Text Class Reference 97

```
• int getBit () override
      getBit(): Get the bit of the Text.
· void draw (sf::RenderWindow &window) const override
      draw(): Draw the Text.

    void update (sf::Time deltaTime) override

      update(sf::Time): Update the component Text
· bool init () override
      init(): Initialize the component.

    void setText (std::map< std::string, std::shared_ptr< sf::Font >> mapFont, const std::string &nameFont,

  const std::string &newStringText, int sizeText, Color fillColor)
      Sets the text of the component.

    void setText (std::map< std::string, std::shared_ptr< sf::Font >> mapFont, const std::string &nameFont,

  const std::string &newStringText, int sizeText, Color fillColor, Color outlineColor)
      Sets the text of the component.

    void setFont (std::map< std::string, std::shared_ptr< sf::Font >> mapFont, const std::string &nameFont)

      setFont(std::map<std::string, std::shared_ptr<sf::Font>>, const std::string&): Set the font of Text.

    void setString (const std::string &newStringText)

      setString(const std::string&): Set the string of Text.

    void setSize (int sizeText)

      setSize(int): Set the size of Text.

    void setOutlineColor (Color outlineColor)

      setOutlineColor(Color): Set the outline color of Text.

    void setFillColor (Color fillColor)

      setFillColor(Color): Set the fill color of Text.

    sf::Text getText () const

      getText(): Get the Text.

    sf::Font getFont () const

      getFont(): Get the Font.

    std::string getStringText () const

      getStringText(): Get the string.
• int getSize () const
      getSize(): Get the size.

    Color getColorFill () const

      getColorFill(): Get the fill color.

    Color getColorOutline () const

      getColorOutline(): Get the outline color.
• Transform * getTransform () override
      getTransform(): Get the reference to the component Transform.

    void setTransform (Transform &newTransform)

      setTransform(Transform&): Set the reference of the Transform component.

    void setDeferredText (std::function < void() > setter)

      setDeferredText(std::function<void()>): Set the deferred text.

    void applyDeferredText ()

      applyDeferredText(): Apply the deferred text.
```

4.27.1 Detailed Description

Text class: Text is a class that represents the text in the world.

The text class manages the text from an Entity using SFML.

4.27.2 Constructor & Destructor Documentation

4.27.2.1 Text() Text::Text () [inline] < Bit of the Text. Default Text constructor. **Parameters** void Returns void 4.27.2.2 ∼Text() Text::~Text () [override], [default] Default override Text destructor. **Parameters** void Returns void 4.27.3 Member Function Documentation

4.27.3.1 applyDeferredText()
void Text::applyDeferredText ()

applyDeferredText(): Apply the deferred text.

4.27 Text Class Reference 99

| Parameters |
|---|
| void |
| |
| Returns |
| void |
| |
| |
| 4.07.0.0 disput() |
| 4.27.3.2 draw() |
| void Text::draw (|
| sf::RenderWindow & window) const [override], [virtual] |
| draw(): Draw the Text. |
| Parameters |
| window SFML RenderWindow where the Text will be drawn. |
| |
| Returns |
| void |
| |
| Implements DrawableComponent. |
| |
| |
| 4.27.3.3 getBit() |
| |
| <pre>int Text::getBit () [override], [virtual]</pre> |
| getBit(): Get the bit of the Text. |
| Parameters |
| void |
| |
| Returns |
| int: The bit of the Text. |

Implements Components.

4.27.3.4 getColorFill()

```
Color Text::getColorFill ( ) const

getColorFill(): Get the fill color.

Parameters

void
```

Returns

Color: Fill color of the text.

4.27.3.5 getColorOutline()

```
Color Text::getColorOutline ( ) const

getColorOutline(): Get the outline color.

Parameters

void
```

Returns

Color: Outline color of the text.

4.27.3.6 getFont()

```
sf::Font Text::getFont ( ) const
getFont(): Get the Font.
Parameters
```

Returns

void

sf::Font: Font of the Text.

4.27 Text Class Reference 101

4.27.3.7 getSize()

```
int Text::getSize ( ) const
getSize(): Get the size.
Parameters
```

Returns

void

int: int number that represents size of the text.

4.27.3.8 getStringText()

```
std::string Text::getStringText ( ) const
getStringText(): Get the string.
```

Parameters

Returns

std::string: String of the text.

4.27.3.9 getText()

```
sf::Text Text::getText ( ) const
getText(): Get the Text.
Parameters
```

Returns

void

sf::Text: Text for draw.

4.27.3.10 getTransform()

```
Transform * Text::getTransform ( ) [override], [virtual]
```

getTransform(): Get the reference to the component Transform.

Parameters

Returns

Transform*: Reference of Transform

Implements ITransform.

4.27.3.11 init()

```
bool Text::init ( ) [override], [virtual]
```

init(): Initialize the component.

Parameters

void

Returns

bool: true if the component is initialized, false otherwise. If no Transform is set, returns false.

Implements Components.

4.27.3.12 setDeferredText()

setDeferredText(std::function<void()>): Set the deferred text.

Parameters

setter Function that will set the text.

4.27 Text Class Reference 103

Returns

void

4.27.3.13 setFillColor()

setFillColor(Color): Set the fill color of Text.

Parameters

| fillColor | Color for the text. |
|-----------|---------------------|
|-----------|---------------------|

Returns

void

4.27.3.14 setFont()

```
void Text::setFont (
          std::map< std::string, std::shared_ptr< sf::Font >> mapFont,
          const std::string & nameFont )
```

setFont(std::map<std::string, std::shared_ptr<sf::Font>>, const std::string&): Set the font of Text.

Parameters

| mapFont | Map of all the font loaded. |
|----------|-----------------------------|
| nameFont | Name of the font loaded. |

Returns

void

4.27.3.15 setOutlineColor()

setOutlineColor(Color): Set the outline color of Text.

Parameters

outlineColor | Color for the border of the text.

Returns

void

4.27.3.16 setSize()

setSize(int): Set the size of Text.

Parameters

sizeText Size of the text.

Returns

void

4.27.3.17 setString()

setString(const std::string&): Set the string of Text.

Parameters

newStringText String text for draw.

Returns

void

4.27.3.18 setText() [1/2]

4.27 Text Class Reference 105

```
const std::string & nameFont,
const std::string & newStringText,
int sizeText,
Color fillColor )
```

Sets the text of the component.

This function sets the Text of the component using the provided font map, the font name, a string for set the Text, the size of character and fill color for color the text.

Parameters

| mapFont | Map of all the font loaded. |
|---------------|-----------------------------|
| nameFont | Name of the font loaded. |
| newStringText | String text for draw. |
| sizeText | Size of the text. |
| fillColor | Color for the text. |

Returns

void

4.27.3.19 setText() [2/2]

Sets the text of the component.

This function sets the Text of the component using the provided font map, the font name, a string for set the Text, the size of character, fill color for color the text and outline color for the border of the text.

Parameters

| mapFont | Map of all the font loaded. |
|---------------|-----------------------------------|
| nameFont | Name of the font loaded. |
| newStringText | String text for draw. |
| sizeText | Size of the text. |
| fillColor | Color for the text. |
| outlineColor | Color for the border of the text. |

Returns

void

4.27.3.20 setTransform()

setTransform(Transform&): Set the reference of the Transform component.

Parameters

newTransform Reference of Transform.

Returns

void

4.27.3.21 update()

update(sf::Time): Update the component Text

Parameters

timeDelta sf::Time of the game.

Returns

void

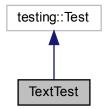

Implements Components.

4.29 toSFML Class Reference

toSFML class: toSFML is a class that convert some class into SFML class.

```
#include <toSFML.h>
```

Inheritance diagram for toSFML:

Public Member Functions

```
• toSFML ()=default
```

Default toSFML constructor.

• \sim toSFML ()=default

toSFML destructor.

• template<typename T >

```
sf::Rect< T> toSFMLRect (Rect< T> rect)
```

toSFMLRect(): Convert your Rect<T> into sf::Rect<T>.

4.29.1 Detailed Description

toSFML class: toSFML is a class that convert some class into SFML class.

Convert some class in SFML class.

4.29.2 Constructor & Destructor Documentation

4.29.2.1 toSFML()

```
toSFML::toSFML ( ) [default]
```

Default toSFML constructor.

| Parameters void Returns |
|---|
| void 4.29.2.2 ∼toSFML() |
| toSFML::~toSFML () [default] toSFML destructor. Parameters void |
| Returns void |

4.29.3 Member Function Documentation

4.29.3.1 toSFMLRect()

```
template<typename T > template sf::Rect< float > toSFML::toSFMLRect ( Rect < T > rect \ )
```

toSFMLRect(): Convert your Rect<T> into sf::Rect<T>.

Template Parameters

T Type of the rect.

Parameters

rect The rect you want to convert.

Returns

sf:Rect<T>: SFML rect.

The documentation for this class was generated from the following files:

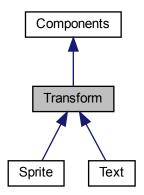

- src/toSFML/include/toSFML.h
- src/toSFML/toSFML.cpp

4.30 Transform Class Reference

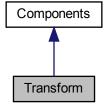

Transform class: Transform is a class that represents the transform of a Component.

```
#include <Transform.h>
```

Inheritance diagram for Transform:

Collaboration diagram for Transform:

Public Member Functions

• Transform ()

Default Transform constructor.

• bool init () override

init(): Initialize the component

∼Transform () override=default

Transform destructor.

• void update (sf::Time deltaTime) override

update(sf::Time): Update the component Music

• int getBit () override

getBit(): Get the bitmask of the component

Vector2< float > getPosition () const

getPositionVector(): Get the position vector of the component;

float getRotation () const

getRotationVector(): Get the rotation vector of the component;

Vector2< float > getScale () const

getScaleVector(): Get the scale vector of the component;

• TransformStruct getTransform () const

getTransform(): Get the the transform of the component;

void setTransform (Vector2< float > newPosition, float newRotation, Vector2< float > newScale)

setTransform(): Set the transform of the component;

void setPosition (Vector2< float > newPosition)

setPosition(): Set the transform position of the component;

void setRotation (float newRotation)

setRotation(): Set the transform rotation of the component;

void setScale (Vector2< float > newScale)

setScale(): Set the transform scale of the component;

void setDeferredTransform (const std::function < void() > &setter)

setDeferredTransform(): Set the deferred transform.

• void applyDeferredTransform ()

applyDeferredTransform(): Apply the deferred transform.

4.30.1 Detailed Description

Transform class: Transform is a class that represents the transform of a Component.

The Transform class manages the position, rotation and scale of a Component.

4.30.2 Constructor & Destructor Documentation

4.30.2.1 Transform()

Transform::Transform () [inline]

Default Transform constructor.

| Implements Components. | |
| implements components. | |
| | |
| | |
| 4.30.3.3 getPosition() | |
| | |
| <pre>Vector2< float > Transform::getPosition () const</pre> | |
| getPositionVector(): Get the position vector of the component; | |
| Parameters | |
| void | |
| | |
| | |
| Returns | |
| std::vector <float>: position vector of the component</float> | |
| | |
| | |
| | |
| 4.30.3.4 getRotation() | |
| | |
| float Transform::getRotation () const | |
| getRotationVector(): Get the rotation vector of the component; | |
| Parameters | |
| void | |
| | |
| Returns | |
| std::vector <float>: rotation vector of the component</float> | |
| | |
| | |
| 4.30.3.5 getScale() | |
| <pre>Vector2< float > Transform::getScale () const</pre> | |

getScaleVector(): Get the scale vector of the component;

Parameters

Returns

std::vector<float>: scale vector of the component

4.30.3.6 getTransform()

```
{\tt Transform::} {\tt TransformStruct\ Transform::} {\tt getTransform\ (\ )\ const}
```

getTransform(): Get the the transform of the component;

Parameters

Returns

TransformStruct: struct of the Transform.

4.30.3.7 init()

```
bool Transform::init ( ) [override], [virtual]
```

init(): Initialize the component

Parameters

Returns

bool: true if the component is initialized, false otherwise

Implements Components.

4.30.3.8 setDeferredTransform()

```
void Transform::setDeferredTransform ( const \ std::function < \ void() > \& \ setter \ )
```

setDeferredTransform(): Set the deferred transform.

Parameters

| setter Function that will set the transform. |
|--|
|--|

Returns

void

4.30.3.9 setPosition()

```
void Transform::setPosition ( \label{eq:vector2} \mbox{Vector2} < \mbox{float} \ > \mbox{\it newPosition} \ )
```

setPosition(): Set the transform position of the component;

Parameters

newPosition : the new Vector2<float> position.

Returns

void

4.30.3.10 setRotation()

setRotation(): Set the transform rotation of the component;

Parameters

```
newRotation: the new float rotation.
```

Returns

void

4.30.3.11 setScale()

```
void Transform::setScale ( {\tt Vector2} < {\tt float} > {\tt newScale} \ )
```

setScale(): Set the transform scale of the component;

Parameters

| newScale | : the new Vector2 <float> scale.</float> |
|----------|--|
|----------|--|

Returns

void

4.30.3.12 setTransform()

setTransform(): Set the transform of the component;

Parameters

| newPosition | : the new Vector2 <float> position.</float> |
|-------------|---|
| newRotation | : the new float rotation. |
| newScale | : the new Vector2 <float> scale.</float> |

Returns

void

4.30.3.13 update()

update(sf::Time): Update the component Music

Parameters

| timeDelta sf::Time of the game. |
|---------------------------------|
|---------------------------------|

Returns

void

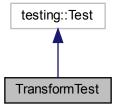

Implements Components.

4.32 Vector2< T > Class Template Reference

Vector class: Vector is a class that represents a vector in 2 dimensions.

```
#include <Vector2.h>
```

Public Member Functions

```
    Vector2 ()
```

< Variable for using the value of the Vector2Struct.

Vector2 (T x, T y)

Vector2 constructor with parameters.

∼Vector2 ()=default

Vector2 destructor.

• Vector2Struct getVector2Struct () const

getVector2Struct(): Get the using Vector2Struct.

• T getX () const

getX(): Get x of Vector2Struct.

• T getY () const

getY(): Get y of Vector2Struct.

void setX (T newX)

setX(): Set x of Vector2Struct.

void setY (T newY)

setY(): Set y of Vector2Struct.

4.32.1 Detailed Description

```
template<typename T> class Vector2< T >
```

Vector class: Vector is a class that represents a vector in 2 dimensions.

This create a vector with 2 value.

4.32.2 Constructor & Destructor Documentation

4.32.2.1 Vector2() [1/2]

```
template<typename T >
Vector2< T >::Vector2 ( ) [inline]
```

< Variable for using the value of the Vector2Struct.

Vector2 constructor with parameters.

Template Parameters

| T | Type of the vector. |
|---|---------------------|
|---|---------------------|

Parameters

| Χ | Position x. |
|---|-------------|
| У | Position y. |

Returns

void

4.32.2.2 Vector2() [2/2]

Vector2 constructor with parameters.

Template Parameters

```
T Type of the vector.
```

Parameters

| Х | Position x. |
|---|-------------|
| У | Position y. |

Returns

void

4.32.2.3 ∼Vector2()

```
template<typename T >
Vector2< T >::~Vector2 ( ) [default]
```

Vector2 destructor.

| Temp | late Parameters |
|-------|---------------------|
| Т | Type of the vector. |
| | |
| | |
| Parar | neters |
| voi | d |
| | <u> </u> |
| | |
| Datus | W 0 |
| Retur | 118 |
| | void |
| | |

4.32.3 Member Function Documentation

4.32.3.1 getVector2Struct()

```
\label{template} $$ template < typename T > $$ template Vector2 < int >::Vector2 Struct Vector2 < T >::getVector2 Struct ( ) const
```

getVector2Struct(): Get the using Vector2Struct.

Parameters

void

Returns

Vector2Struct

4.32.3.2 getX()

```
template<typename T >
template int Vector2< T >::getX ( ) const
```

getX(): Get x of Vector2Struct.

Template Parameters

4.32.3.3 getY()

```
template<typename T >
template int Vector2< T >::getY ( ) const
getY(): Get y of Vector2Struct.
```

Template Parameters

4.32.3.4 setX()

setX(): Set x of Vector2Struct.

Template Parameters

Parameters

newX The new value of x.

Returns

void

4.32.3.5 setY()

setY(): Set y of Vector2Struct.

Template Parameters

T Type of the Vector2

Parameters

| wY The new value of y. | newY |
|------------------------|------|
|------------------------|------|

Returns

void

#include <world.h>
```

Inheritance diagram for World:

4.33 World Class Reference 125

Collaboration diagram for World:

Public Member Functions

• World ()=default

Default World constructor.

∼World () override=default

World destructor.

• bool init () override

init(): Initialize the world.

void createEntities (std::map< std::string, std::pair< std::unique_ptr< EntityManager >, std::vector< std
 ::string >>> &mapEntityManager)

createEntities(): Create the entities.

• EntityManager & addEntityManager (const std::string &NameEntityManager)

addEntityManager(): Add an entity manager to the map.

• EntityManager & getEntityManager (const std::string &NameEntityManager)

getEntityManager(): Get the entity manager.

void setNameWorld (std::string newName)

setNameWorld(): Set the name of the world.

• std::string getNameWorld () const

getNameWorld(): Get the name of the world.

• std::map< std::string, EntityManager * > getEntityManagerMap () const

getEntityManagerMap(): Get the map of the entity manager.

• std::map< std::string, EntityManager * > getEntitiesManager () const

getEntitiesManager(): Get the entities

Additional Inherited Members

4.33.1 Detailed Description

World class: World is a class that represents the world of the game.

The World class manages the world of the game.

4.33.2 Constructor & Destructor Documentation

4.33.3 Member Function Documentation

4.33 World Class Reference 127

4.33.3.1 addEntityManager()

addEntityManager(): Add an entity manager to the map.

Parameters

| NameEntityManager | Name of the entity manager. |
|-------------------|-----------------------------|
| | |

Returns

EntityManager&: The entity manager.

4.33.3.2 createEntities()

createEntities(): Create the entities.

Parameters

| mapEntityManager | Map of the entities manager's unique pointers. |
|------------------|--|
| keyEntityManager | Key of the entities manager. |

Returns

void

4.33.3.3 getEntitiesManager()

```
\verb|std::map| < \verb|std::string|, | EntityManager * > \verb|World::getEntitiesManager| ( ) | const| \\
```

getEntitiesManager(): Get the entities

Parameters

void

Returns

std::map<std::string, EntityManager*>: Get the entities.

4.33.3.4 getEntityManager()

getEntityManager(): Get the entity manager.

Parameters

| NameEntityManager | Name of the entity manager. |
|-------------------|-----------------------------|
|-------------------|-----------------------------|

Returns

EntityManager&: The entity manager.

4.33.3.5 getEntityManagerMap()

```
\verb|std::map| < \verb|std::string|, EntityManager| * > \verb|World::getEntityManagerMap| ( ) const| \\
```

getEntityManagerMap(): Get the map of the entity manager.

Parameters

void

Returns

std::map<std::string, EntityManager*>: The map of the entity manager.

4.33.3.6 getNameWorld()

std::string World::getNameWorld () const

getNameWorld(): Get the name of the world.

Parameters

void

4.33 World Class Reference 129

Returns

std::string: The name of the world.

4.33.3.7 init()

```
bool World::init ( ) [override], [virtual]
```

init(): Initialize the world.

Parameters

Returns

bool: True if the world is initialized, false otherwise.

Reimplemented from EntityManager.

4.33.3.8 setNameWorld()

setNameWorld(): Set the name of the world.

Parameters

| newName New name of the wo |
|------------------------------|
|------------------------------|

Returns

void

The documentation for this class was generated from the following files:

- src/World/include/world.h
- src/World/world.cpp
